

HONDA GOLDWING

About This Manual

The service procedures in this supplement are unique to the 1985 GL1200L. In those instances where the Interstate or Aspencade model procedures apply, refer to the base service manual.

The GL1200L Service Manual Supplement is divided into 14 sections. The first page of each section is marked with a black tab that lines up with the tabs on this page. The section symbols printed on the tabs also appear at the top of each page of the section so you can quickly get to where you want to be in the manual.

Page one of sections 1-13 lists the contents of each section and gives specific page references. Section 14 is an overall index for this supplement. A Wiring Diagram is located inside the back cover.

In sections 10 through 13, "Service Information" follows each contents; be sure to read those few lines before you start any procedure to avoid any difficulty once you're in the middle of a job. In most cases a torque reference drawing will be in Service Information. Torque values are given in the metric standard newton-meters (N.m) and also in foot-pounds (ft-lb). (See page 1-6 for a specific explanation of the use of metric equivalents.) A system troubleshooting list follows the torque reference drawing, and then the service procedures begin.

Sections 1-3 apply to the whole motorcycle, while sections 4-13 describe parts of the GL1200L grouped according to location. Be sure to refer to the Maintenance Schedule (Section 3) whenever a GL1200L is brought in for service. Use the schedule to know what the vehicle needs to stay in peak operating condition and within EPA-established emissions standards. The first scheduled maintenance is especially important since it compensates for the initial wear that occurs during the break-in period.

All information, illustrations, directions and specifications included in this publication are based on the latest product information available at the time of approval for printing. Honda Motor Co., Inc. reserves the right to make changes at any time without notice and without incurring any obligation whatever.

General Information

Service Safety

Pay special attention to statements preceded by these symbols.

WARNING: Indicates a strong possibility of severe personal injury or loss of life if instructions are not followed.

CAUTION: Indicates a possibility of personal injury or equipment damage if instructions are not followed.

WARNING:

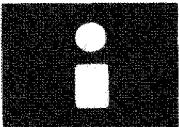

- If the engine must be running to do some work, make sure the area is well ventilated. Never run the engine in a closed area. The exhaust contains poisonous carbon monoxide gas.
- Gasoline is extremely flammable and is explosive under certain conditions. Do not smoke or allow flames or sparks in your working area.
- The battery electrolyte contains sulfuric acid. Protect your eyes, skin, and clothing. In case of contact, flush thoroughly with water, and call a doctor if electrolyte gets in your eyes.
- The battery generates hydrogen gas which can be highly explosive. Do not smoke or allow flames or sparks near the battery, especially while charging it.

IMPORTANT SAFETY NOTICE

Detailed descriptions of standard workshop procedures, safety principles, and service operations are not included. It is important to note that this manual contains some warnings and cautions against some specific service methods which could cause PERSONAL INJURY to service personnel or could damage a vehicle or render it unsafe. Please understand that those warnings could not cover all conceivable ways in which service, whether or not recommended by Honda, might be done, or of the possibly hazardous consequences of each conceivable way, nor could Honda investigate all such ways. Anyone using service procedures or tools, whether or not recommended by Honda must satisfy himself thoroughly that neither personal safety nor vehicle safety will be jeopardized by the service methods or tools selected.

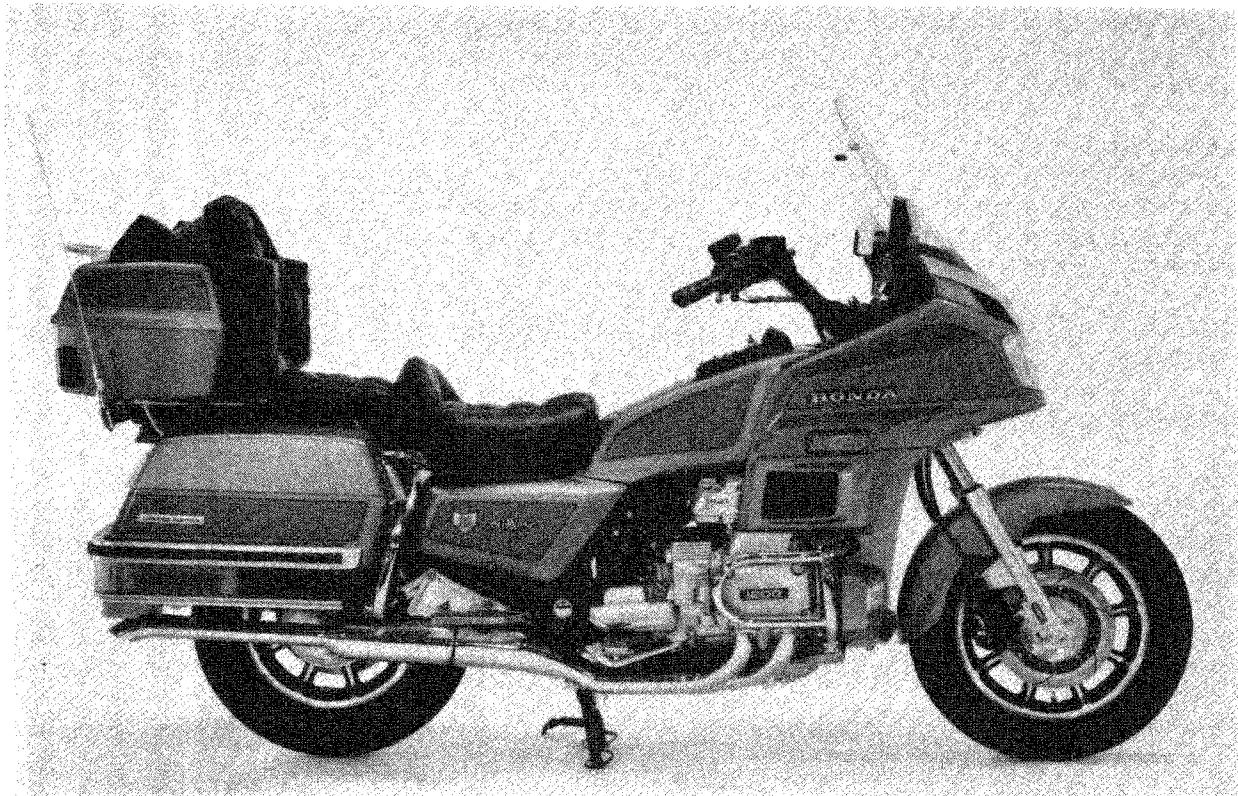

Service Rules

1. Use genuine Honda or Honda-recommended parts and lubricants or their equivalent. Parts that do not meet Honda's design specifications may damage the motorcycle.
2. Use the special tools designed for this product.
3. Use only metric tools when servicing this motorcycle. Metric bolts, nuts, and screws are not interchangeable with English fasteners. The use of incorrect tools and fasteners may damage the motorcycle.
4. Install new gaskets, O-rings, cotter pins, lock plates, etc., when reassembling.
5. When tightening bolts or nuts, begin with larger-diameter or inner bolts first, and tighten to the specified torque diagonally in 2-3 steps, unless a particular sequence is specified.
6. Clean parts in high flash point solvent after disassembly. Lubricate any sliding surfaces before reassembly.
7. After reassembly, check all parts for proper installation and operation.

General Information

Emission Control Systems

The U.S. Environmental Protection Agency and California Air Resources Board (CARB) require manufacturers to certify that their motorcycles comply with applicable exhaust emissions standards during their useful life when operated and maintained according to the instructions provided, and that motorcycles built after January 1, 1983, comply with applicable noise emission standards for one year or 6,000 km (3,730 miles) after the time of sale to the ultimate purchaser, when operated and maintained according to the instructions provided. Compliance with the terms of the Distributor's Warranties for Honda Motorcycle Emission Control Systems is necessary in order to keep the emissions system warranty in effect.

Source of Emissions

The combustion process produces carbon monoxide and hydrocarbons. Control of hydrocarbons is very important because, under certain conditions, they react to form photochemical smog when subjected to sunlight. Carbon monoxide does not react in the same way, but it is toxic.

Honda Motor Co., Ltd. utilizes a secondary air supply system, as well as other systems, to reduce carbon monoxide and hydrocarbons.

Exhaust Emission Control System (Secondary Air Supply System)

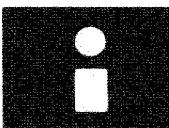

The exhaust emission control system consists of a secondary air supply system which introduces filtered air into the exhaust gases in the exhaust port. Fresh air is drawn into the exhaust port whenever there is a negative pressure pulse in the exhaust system. This charge of fresh air promotes burning of the unburned exhaust gases and changes a considerable amount of hydrocarbons and carbon monoxide into relatively harmless carbon dioxide and water.

The reed valve prevents reverse air flow through the system. The anti-afterburn valve reacts to high intake|vacuum and will cut off the supply of fresh air during engine deceleration, thereby preventing afterburn in the exhaust system.

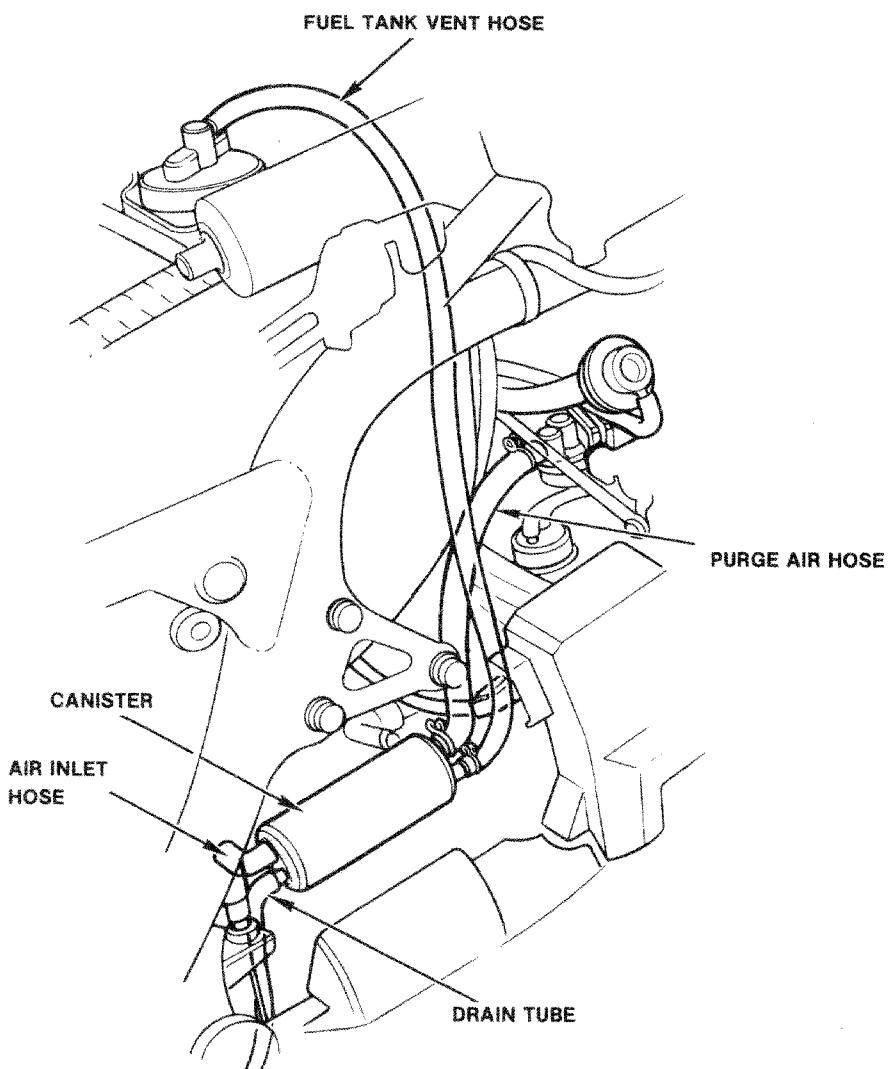

No adjustments to the secondary air supply system should be made, although periodic inspection of the components is recommended.

Crankcase Emission Control System

The engine is equipped with a closed crankcase system to prevent crankcase emissions from being discharged into the atmosphere. Blow-by gases are returned to the combustion chamber through the air cleaner. Condensed crankcase vapors are accumulated in a storage tank which must be emptied periodically.

Evaporative Emission Control System (California Only)

This motorcycle complies with California Air Resources Board requirements for evaporative emission regulations. Fuel vapor from the fuel tank is routed into a charcoal canister where it is adsorbed and stored while the engine is stopped. When the motorcycle is running and the purge control diaphragm valve is open, fuel vapor in the charcoal canister is drawn into the engine.

No adjustments to the evaporative emission control system are necessary; however, periodic inspection of the hoses and canister is recommended.

General Information

Emission Control Systems (cont'd)

Noise Emission Control System

TAMPERING WITH THE NOISE CONTROL SYSTEM IS PROHIBITED: Federal law prohibits the following acts or the causing thereof: (1) The removal or rendering inoperative by any person, other than for purposes of maintenance, repair or replacement, of any device or element of design incorporated into any new vehicle for the purpose of noise control prior to its sale or delivery to the ultimate purchaser or while it is in use; or (2) the use of the vehicle after such device or element of design has been removed or rendered inoperative by any person.

AMONG THOSE ACTS PRESUMED TO CONSTITUTE TAMPERING ARE THE ACTS LISTED BELOW:

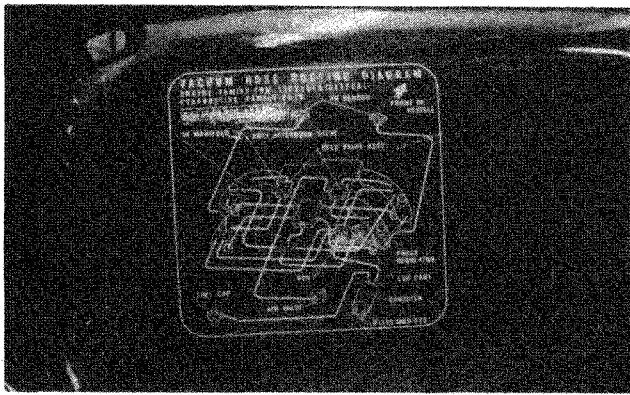

1. Removal of, or puncturing the muffler, baffles, header pipes or any other component which conducts exhaust gases.
2. Removal of, or puncturing of any part of the intake system.
3. Lack of proper maintenance.
4. Replacing any moving parts of the vehicle, or parts of the exhaust or intake system, with parts other than those specified by the manufacturer.

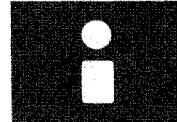

Emission Control Information Label

The Emission Control Information Label is located on the frame tube below the rear brake pedal and carries tune up specifications for the motorcycle.

Vacuum Hose Routing Diagram Label (California Only)

A Vacuum Hose Routing Diagram Label is attached to the fuel tank behind the right side cover. Route the vacuum hoses as shown on this label.

Metric Conversions

To convert from metric to English equivalents, use the following conversion factors.

* Should be serviced by an authorized Honda dealer, unless the owner has proper tools and service data and is mechanically inclined.

** In the interest of safety, we recommend these items be serviced only by an authorized Honda dealer.

*** If a page reference is not listed, consult the GL1200I/A Service Manual.

- NOTES:
1. Service more frequently when riding in dusty areas.
 2. Service more frequently when riding in rain or at full throttle.
 3. California type only.
 4. For higher odometer readings, repeat at the frequency interval established here.

Fuel Filter

WARNING:

- Gasoline is flammable and is explosive under certain conditions. Do not smoke or allow flames or sparks in your working area.
- The fuel lines are pressurized. Wear eye protection when working on the fuel system. If gasoline gets in your eyes, flush with water and get prompt medical attention.

Turn the fuel valve and ignition switch OFF.

Wrap a shop towel around the fuel line and fittings. Loosen the fuel line banjo bolts slowly to drain the lines and filter and to keep gasoline from spraying out.

Remove the banjo bolts to disconnect the fuel lines. Loosen the 6 mm clamp bolt, and remove the filter from its bracket.

Install the new filter in the filter bracket. Connect the fuel lines.

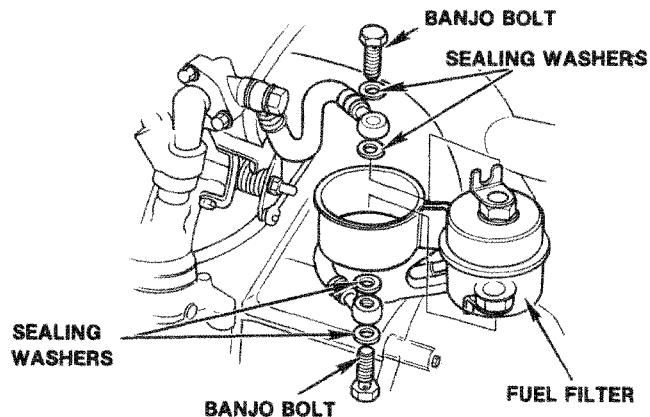

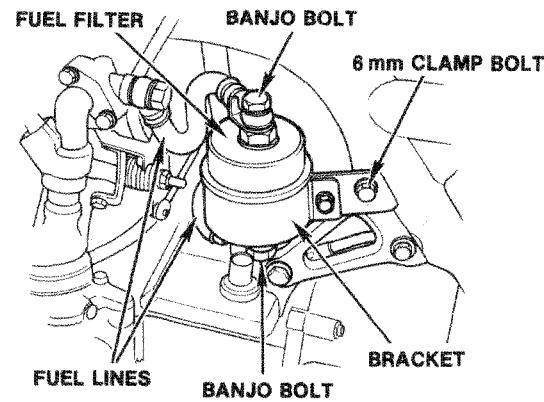

NOTE: Use new sealing washers. Align the fuel line with the filter stopper.

Tighten the banjo bolts.

Torque: 22 N.m (16 ft-lb)

Tighten the 6 mm clamp bolt.

Turn the ignition switch ON to check for fuel line leaks.

Maintenance

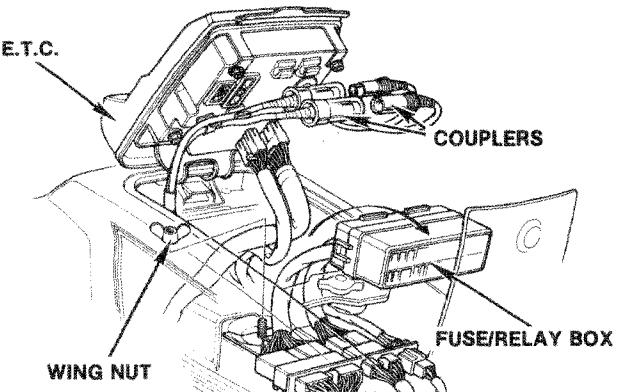

Air Cleaner

Open the top compartment cover.

Pull the fuse/relay box up and to the rear.

Disconnect the couplers from the E.T.C.

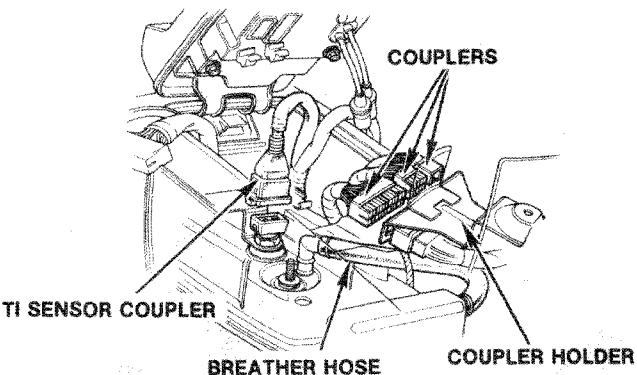

Remove the wing nut.

Disconnect the three couplers to remove the fuse/relay box and coupler holder.

Disconnect the T1 sensor coupler and the breather hose from the air cleaner cover.

Remove the air cleaner cover.

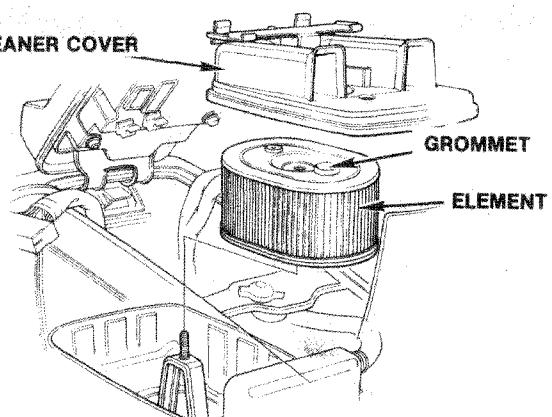

Remove and discard the air cleaner element.

Install the new element with the breather hose grommet facing the rear.

Install the air cleaner cover with wing nut, and attach the breather hose.

Install parts in the reverse order of removal.

NOTE: Be careful not to damage the coupler terminals during installation.

Throttle Valve Synchronization

NOTE: Perform this maintenance with the engine at normal operating temperature, transmission in neutral, and motorcycle on its center stand.

Remove the throttle body covers, right and left fairing lower covers and inner covers.

Remove the plugs from the intake pipes and install vacuum gauge adapters and vacuum gauges.

Start the engine and adjust the idle speed with the throttle stop screw.

Idle speed: 1000 ± 100 rpm

The difference in vacuum readings should be 40 mm (1.6 in) Hg or less.

Turn the adjusting screw to fix any difference in vacuum readings between the right (#1 and 3) and left (#2 and 4) bank cylinders. If any one cylinder vacuum reading is low, check for a secondary air leak past the intake pipe.

Adjustment between the front and rear cylinders (#1 and 3, or #2 and 4) are not possible. Differences in vacuum readings between these cylinders is probably due to carbon build-up on the throttle valve.

To clean the throttle valve, remove the air cleaner case and element holder.

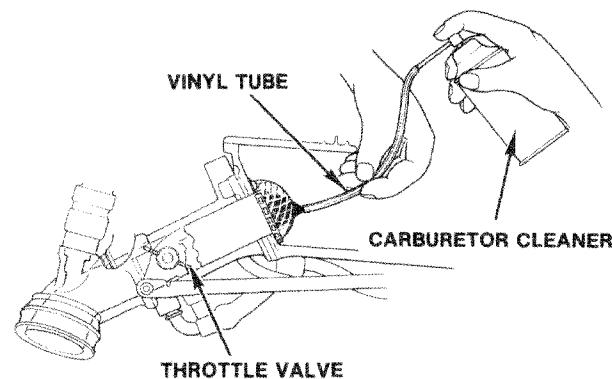

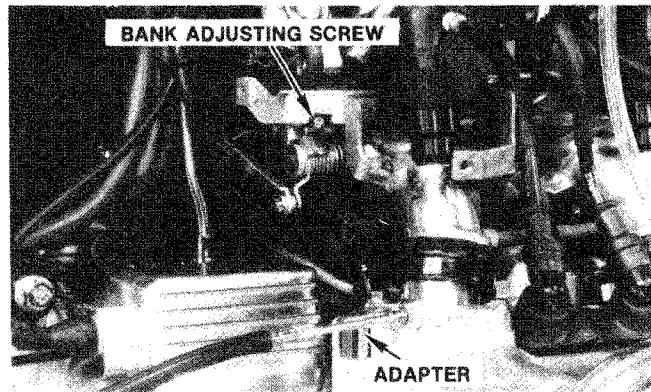

Connect the coupler to the T1 sensor. Connect a vacuum gauge. Start the engine and let it idle.

NOTE: Keep dirt from being drawn into the air chamber. Use a vinyl hose to spray carburetor cleaner into the intake pipe through the wire screen.

NOTES:

- Decarbonize the throttle valve with the highest vacuum reading first, the lowest last.
- Snap the throttle while spraying the cleaner.
- Use a cleaner containing a rust inhibitor.

The idle speed will rise when the throttle valves on both banks are synchronized. After the difference in vacuum has been stabilized within 40 mm (1.6 in) Hg or less, install the air cleaner case and element. Recheck throttle valve synchronization and idle speed.

Maintenance

Cruise Valve Element

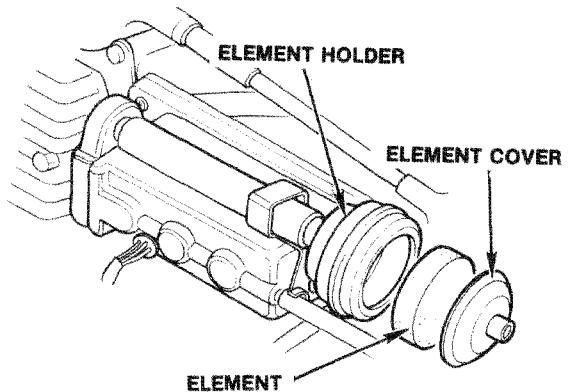

Remove the seat, side covers, and top compartment.

Remove the element cover.

Remove and discard the cruise valve element.

Install the new element and assemble the parts in reverse order of removal.

WARNING: Do not block the air inlet hole or hose during installation, or the cruise control will not disengage.

Engine Removal/Installation

Removal.....	4-2
Installation.....	4-6

goldwingdocs.com

Engine Removal/Installation

Removal

Disconnect the battery ground cable.

NOTE: Drain the engine oil if the front or rear cover will be removed. Install the drain plug.

For easiest access to the electrical couplers, remove the fairing.

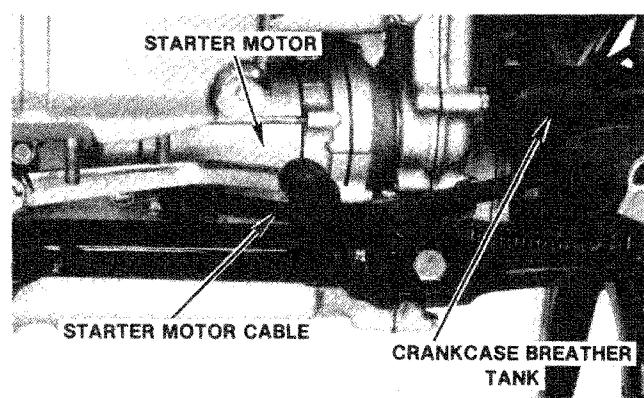

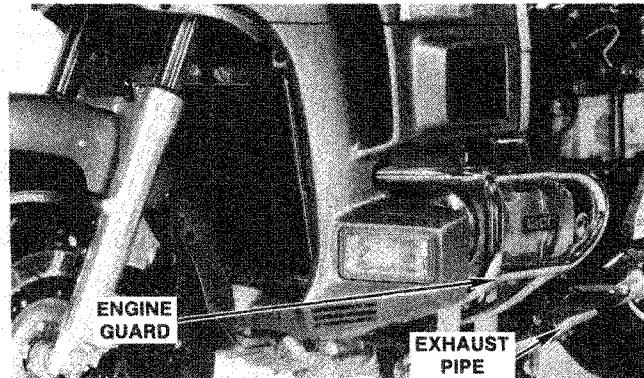

Remove the radiator.

Remove the exhaust pipes and engine guards.

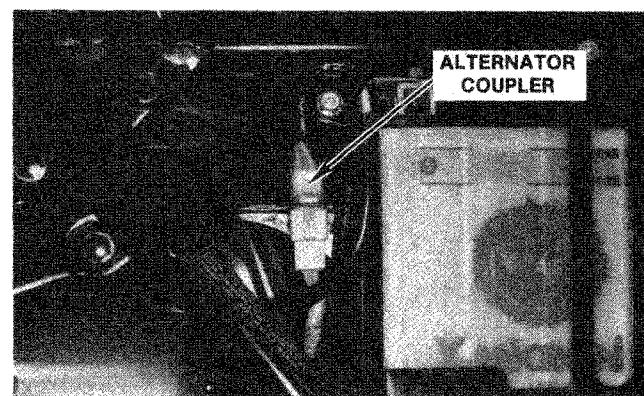

Remove the air chamber assembly (see page 10-34).

Disconnect the starter motor cable at the starter.

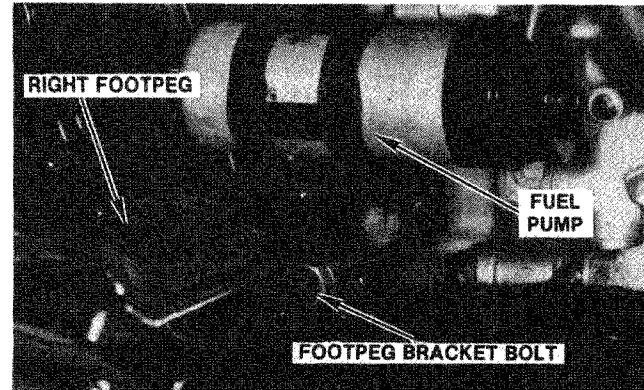

Remove the crankcase breather tank.

Disconnect the alternator coupler.

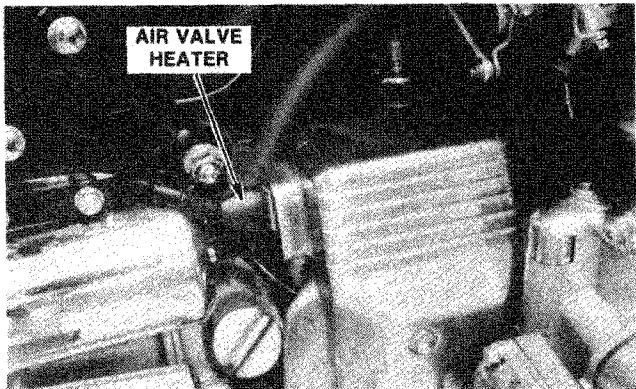

Remove the fuel pump and right footpeg bracket bolt. Remove the foot peg and support the fuel pump with string or wire.

Disconnect the air valve heater coupler from the air valve.

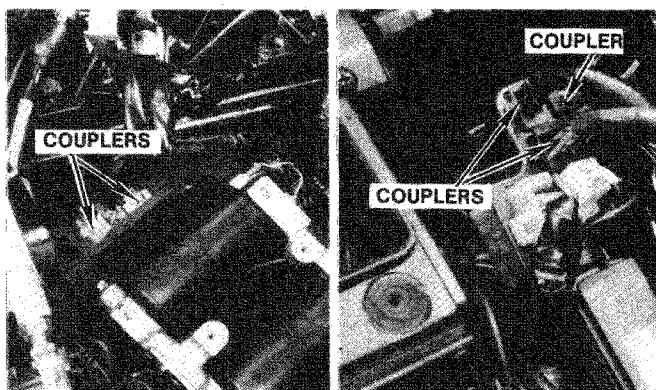

Disconnect the gear shift sensor wire coupler.

Disconnect the engine sub-harness (white 2P and red 6P) couplers.

Disconnect the Ns sensor wire (white 2P, yellow/white wires) coupler.

Disconnect the GR/GL sensor wire (white 4P coupler).

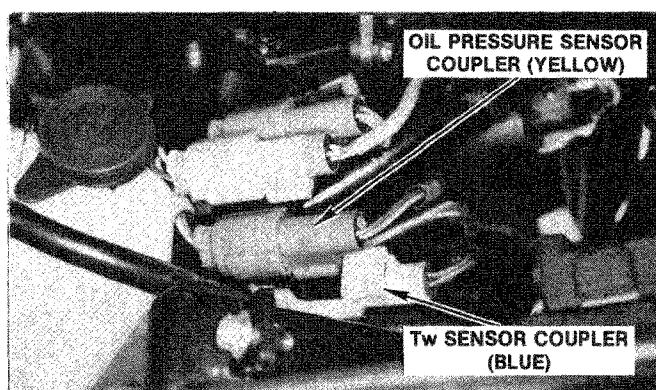

Release the wires from the wire band.

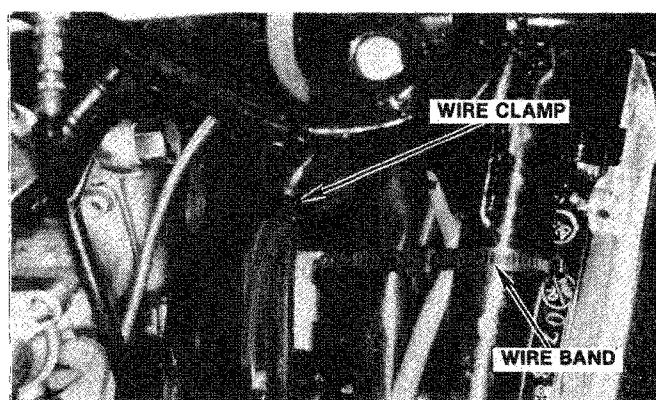

Disconnect the oil pressure sensor (yellow waterproof 3P) coupler.

Disconnect the Tw sensor (blue waterproof 2P) coupler.

Release the wires from the wire bands.

Release the engine sub-harness, shift sensor wire, Ns sensor wire, and fan motor wires from the wire bands and wire clamps.

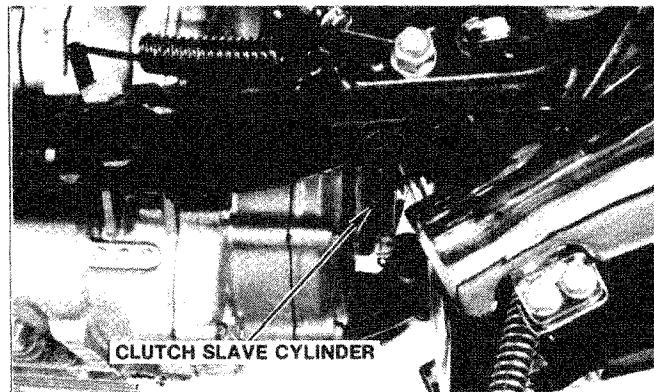

(cont'd)

Engine Removal/Installation

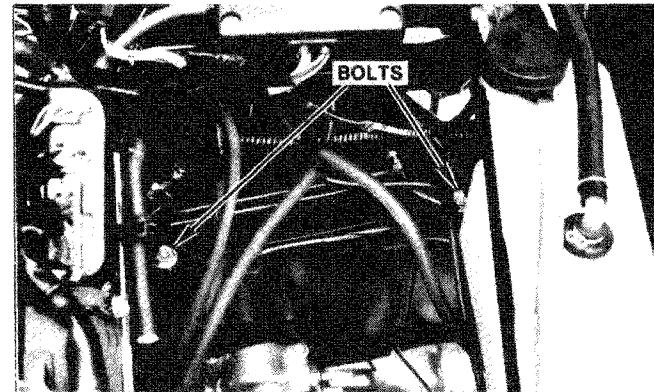

Removal (cont'd)

Remove the clutch slave cylinder from the engine. The pushrod should stay in the engine.

NOTE: Pull the clutch lever in and tie it to the handlebar grip. This prevents overextension of the slave cylinder piston.

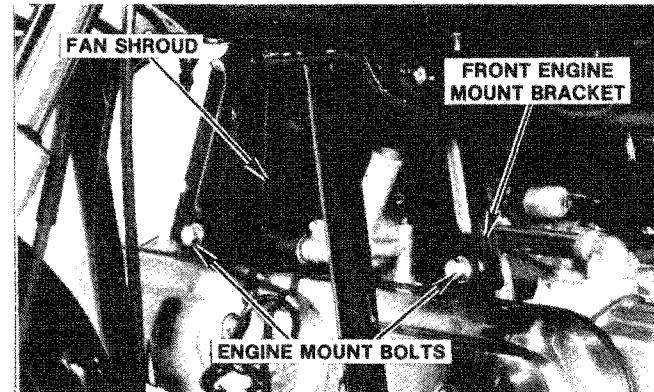

Remove the two bolts from the top of the front engine mount bracket.

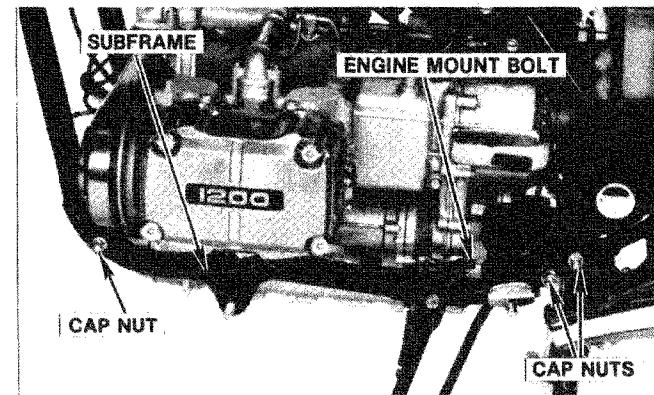

Remove the two bolts from the bracket front.

Remove the fan shroud and the front bracket.

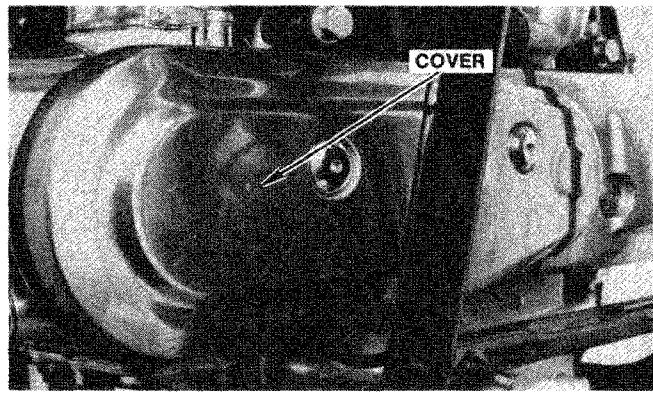

Remove the left engine mount bolt and the cap nuts, then remove the subframe.

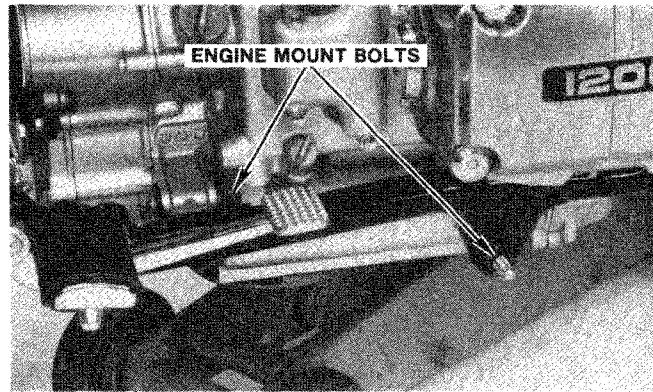

Remove the right timing belt cover for added clearance during engine removal.

Place a floor jack or other adjustable support under the engine.

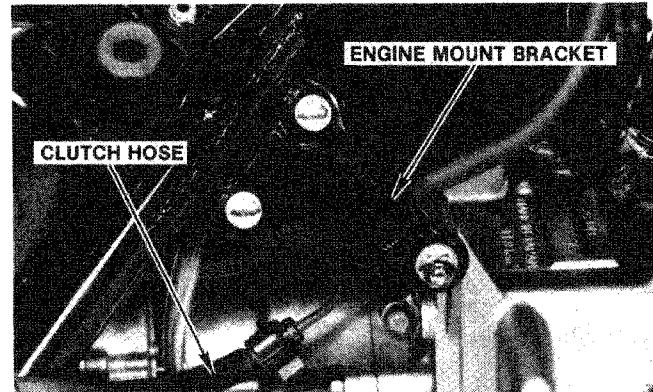

NOTE: The jack height must be continually adjusted as mounting bolts are removed to relieve stress from remaining bolts.

Remove the right engine mount bolts.

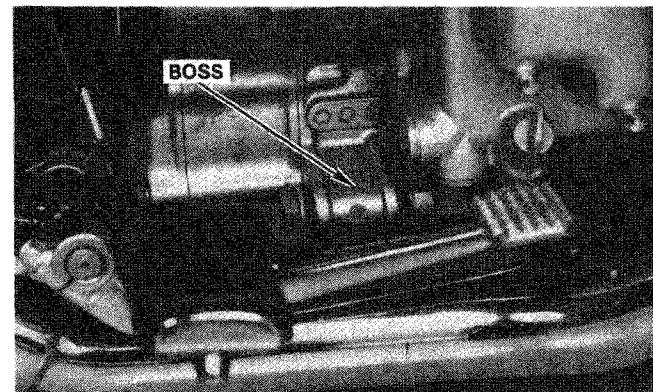

Remove the triangular engine mount bracket from each side.

Release the clutch hose from the hose clamp.

With the aid of another person to steady the engine, adjust the jack while you raise the right rear engine mount boss out of the frame tabs.

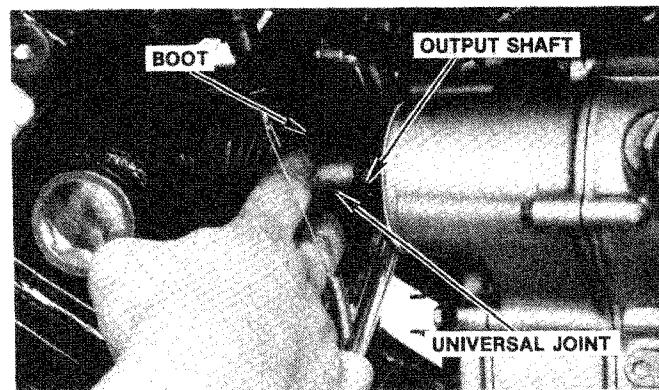

(cont'd)

Engine Removal/Installation

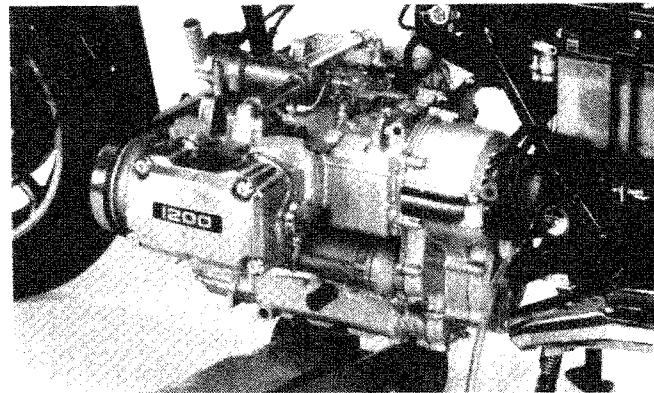

Removal (cont'd) —

Move the engine forward to disengage the output shaft from the universal joint.

Move the engine out of the frame.

CAUTION: Be careful not to damage the brake lines during engine removal.

Installation —

Install the engine in the reverse order of removal.

Lubricate the output shaft splines with a multipurpose NLGI no. 2 grease with 40% molybdenum disulfide (MoS₂) additive.

Carefully maneuver the engine into the frame while aligning the output shaft with the universal joint.

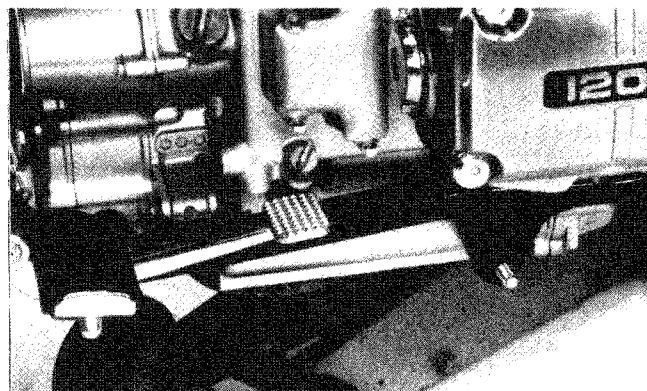

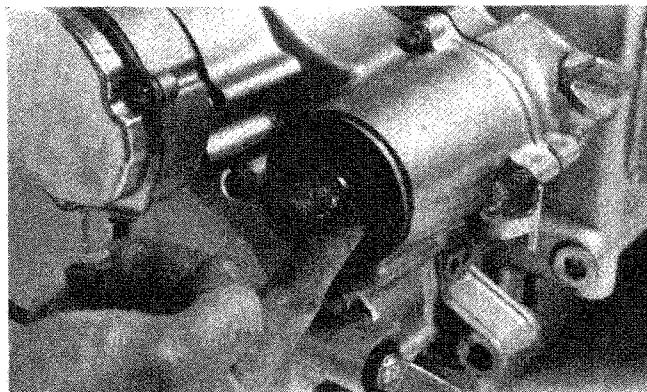

CAUTION: Be careful not to damage the brake lines during installation.

Slide the output shaft back into the universal joint.

CAUTION: Carefully align mounting points with the jack to prevent damage to mounting bolt threads, wire harnesses and cables.

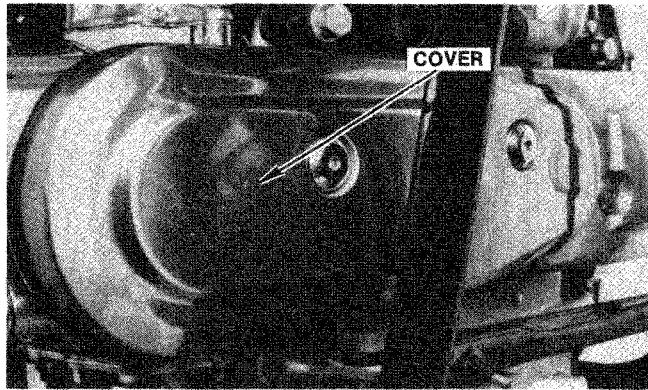

Hand tighten mounting bolts and nuts (and install parts noted) in this order:

1. The left and then the right rear mount bolts.
2. The subframe and footpeg bolts.
3. The forward mount bolt.
4. The right and left mount brackets and upper engine mount bolts, including the battery ground with the left side mount.
5. The upper and lower front mount bracket bolts.

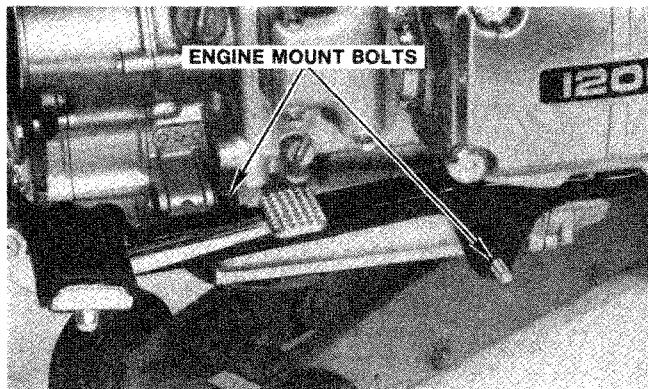

Remove the right timing belt cover for added clearance during engine removal.

Place a floor jack or other adjustable support under the engine.

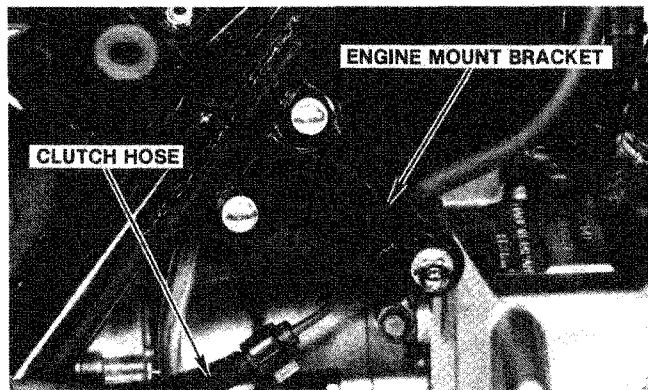

NOTE: The jack height must be continually adjusted as mounting bolts are removed to relieve stress from remaining bolts.

Remove the right engine mount bolts.

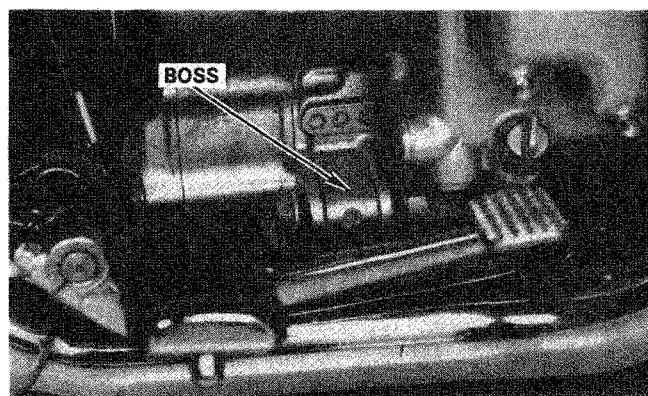

Remove the triangular engine mount bracket from each side.

Release the clutch hose from the hose clamp.

With the aid of another person to steady the engine, adjust the jack while you raise the right rear engine mount boss out of the frame tabs.

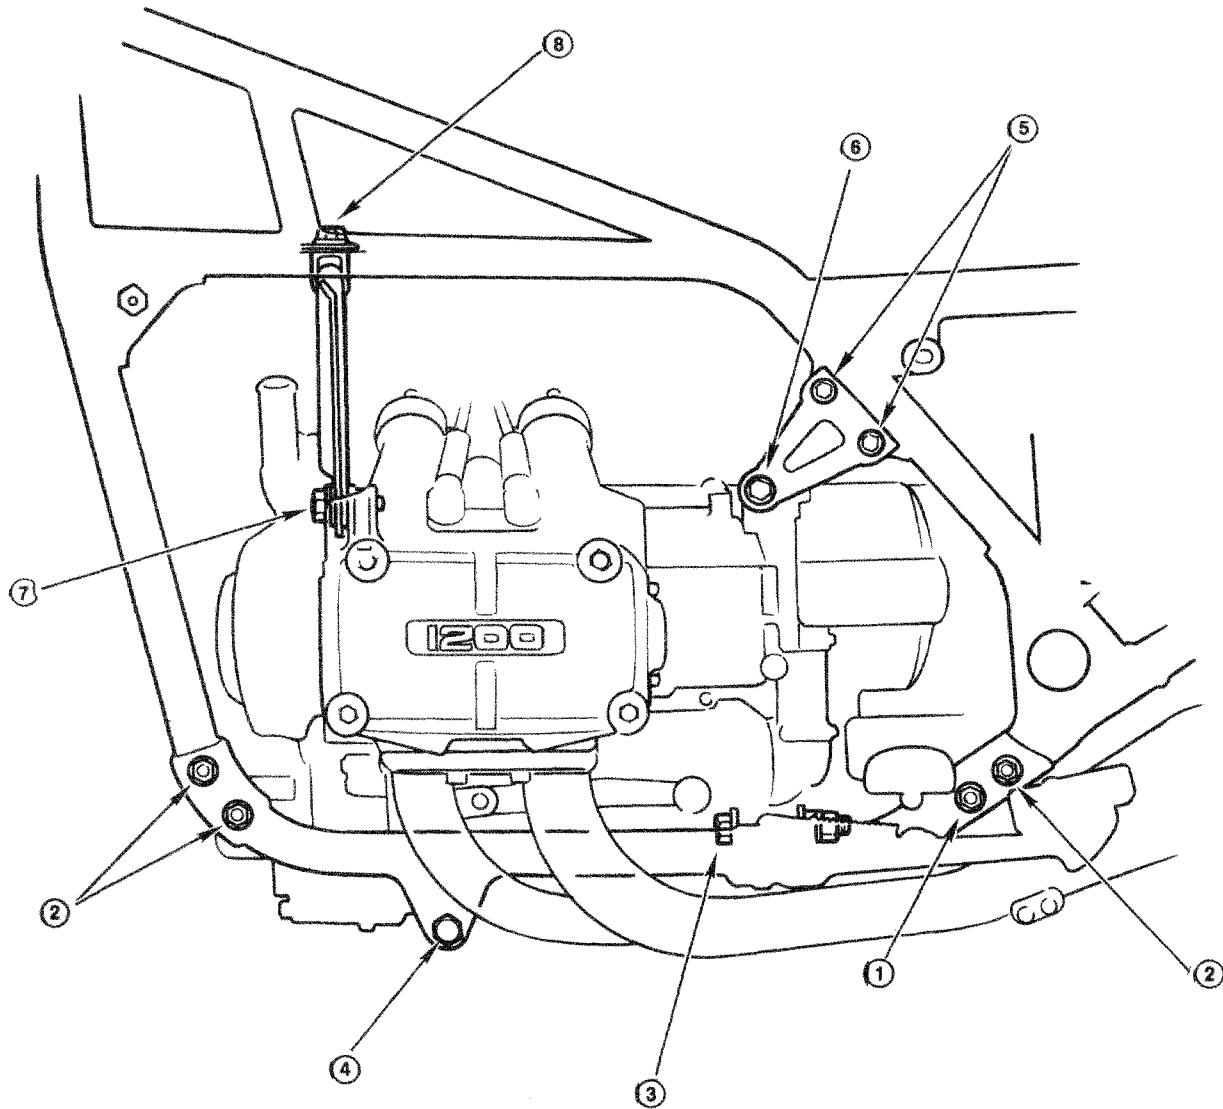

(cont'd)

Remove the jack and torque the mounting bolts in the sequence shown:

1. 60 N.m (43 ft-lb) Left side only
2. 35 N.m (25 ft-lb) Left side only
3. 60 N.m (43 ft-lb)
4. 60 N.m (43 ft-lb)
5. 22 N.m (16 ft-lb)
6. 35 N.m (25 ft-lb)
7. 35 N.m (25 ft-lb)
8. 22 N.m (16 ft-lb)

Frame/Suspension

Handlebar Replacement.....	5-2
Front Fork Illustration.....	5-3
Rear Shock Illustration.....	5-3

goldwingdocs.com

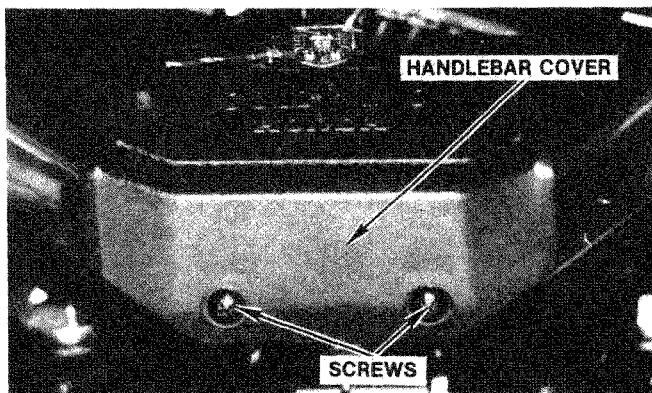

Frame/Suspension Handlebar Replacement

Removal

Remove the clutch lever and brake master cylinder from the handlebar.

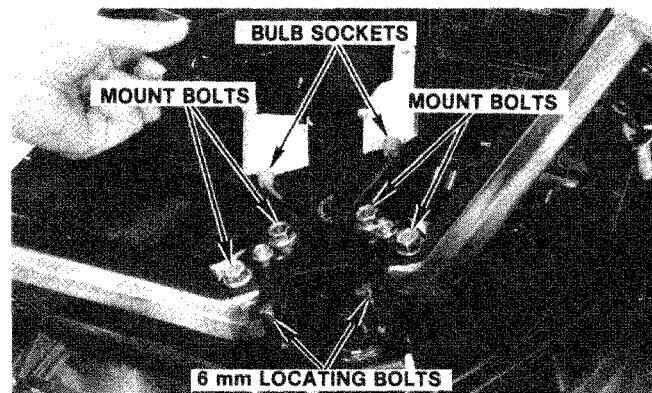

Remove the handlebar switch.

Release the handlebar cover by removing two screws.

Remove the two 6 mm locating bolts and four handlebar mount bolts.

Remove the set plate and handlebar.

Installation

Install the handlebar in the reverse order of removal.

Torque:

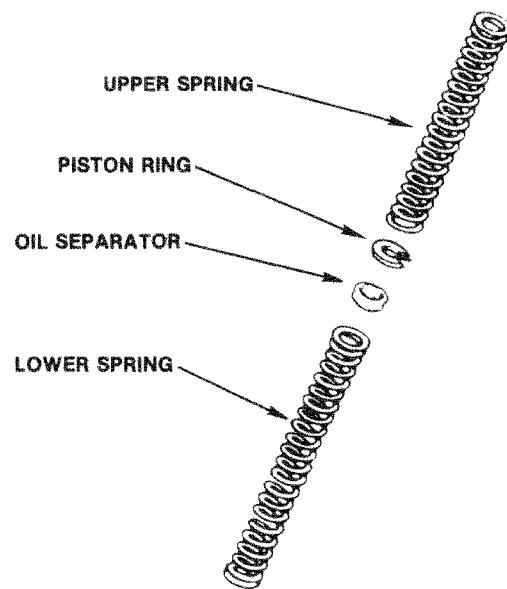

Handlebar mount bolt (10 mm): 35 N.m (26 ft-lb)

Handlebar locating bolt (6 mm): 10 N.m (7 ft-lb)

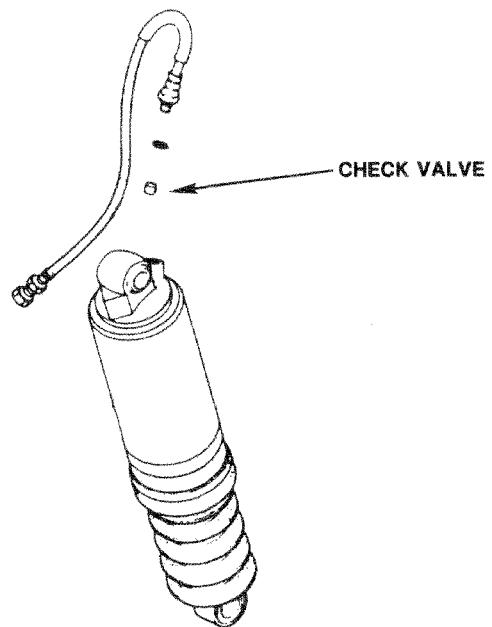

Front Fork Illustration

The GL1200L has an extra piston ring and an oil separator between the upper and lower fork springs.

Rear Shock Illustration

The GL1200L has a check valve at each rear shock absorber.

Brakes

Front Master Cylinder..... 6-2

goldwingdocs.com

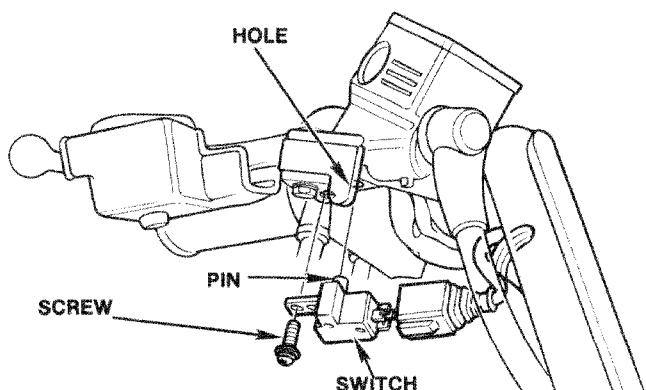

Brakes

Front Master Cylinder

Removal/Disassembly

Remove and disassemble according to the base manual procedures.

Remove the brake light/cruise cancel switch from the master cylinder by loosening the screw.

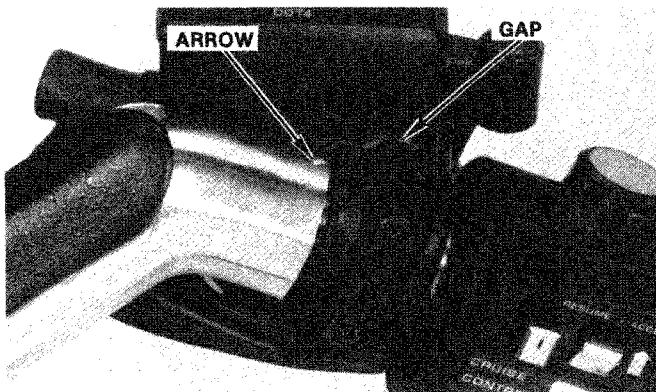

Installation

Align the gap between the holder and the master cylinder with the arrow on the handlebar.

Install the brake light/cruise cancel switch by aligning the switch pin with the master cylinder hole.

Tighten the screw securely.

Ignition

Service Information	7-2
Troubleshooting	7-4
Ignition Timing	7-5
Ignition Coil	7-6
Spark Unit	7-7
Spark Unit Resister	7-8

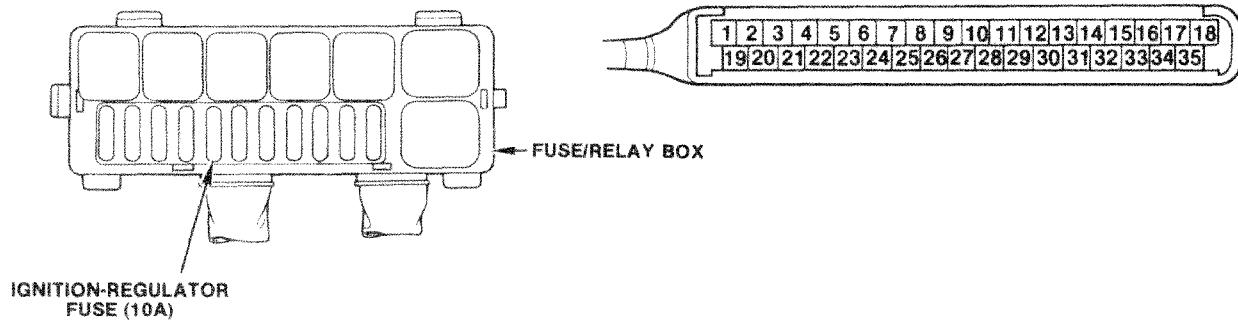

Ignition System

Service Information

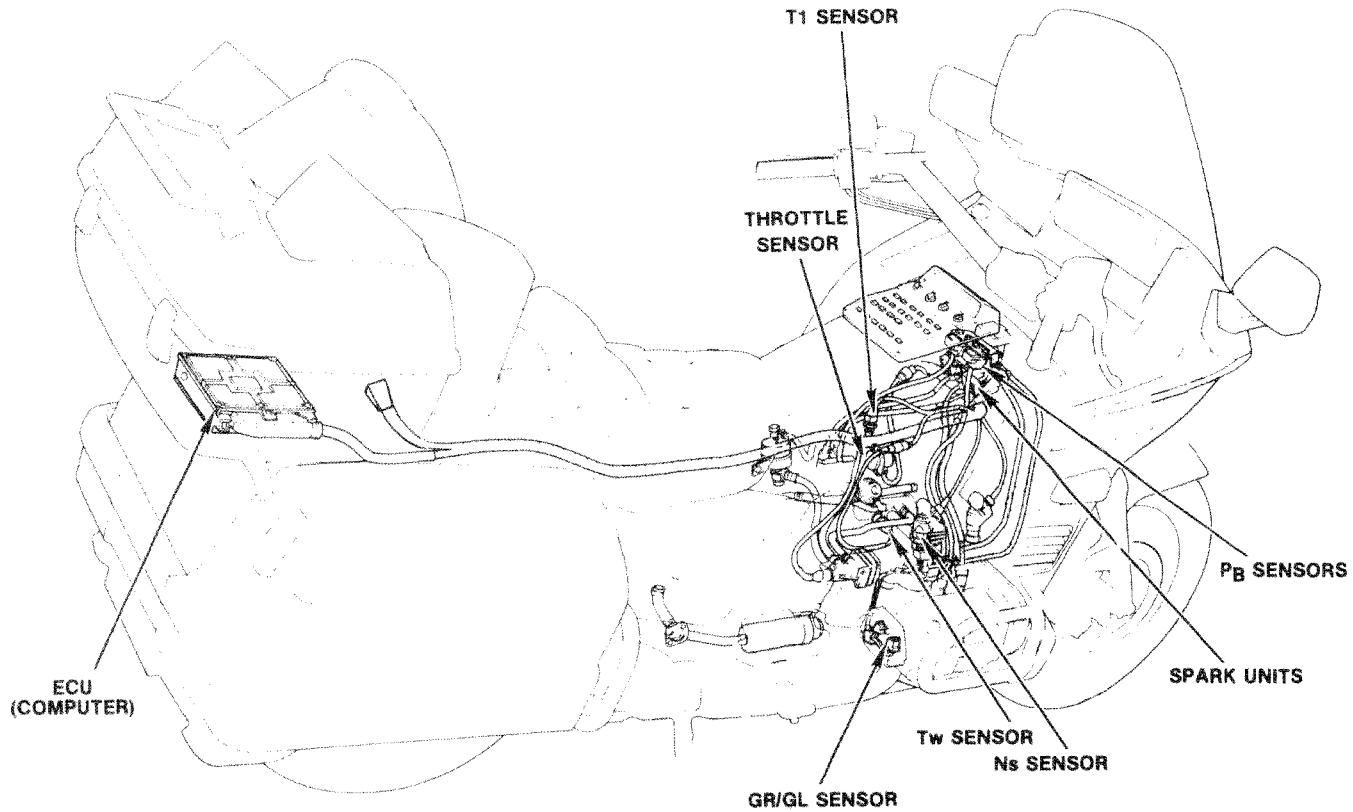

- Ignition timing is electronically controlled by the CFI electronic control unit (ECU), which receives input signals from these sensors: Ns, PB, Oth, GR/GL, and TW. Refer to the CFI System (Section 10) for sensor inspection.
- Be sure the battery is fully charged before troubleshooting the ignition system.
- Measuring outputs at coupler pins: Insert the tester probes from behind the coupler pins to avoid bending or prying them open. Be careful not to short out pins.
- Disconnecting a coupler or connector: Turn the ignition switch OFF. Positive (+) and negative (-) sides are so marked. Do not remove waterproof grommets from the couplers.

Fuses/Relays

ECU Coupler Pin Numbers

Parts Location

Troubleshooting

Follow the troubleshooting sequence given here if the engine does not start. If the engine starts but runs poorly, check ignition timing (see page 7-5).

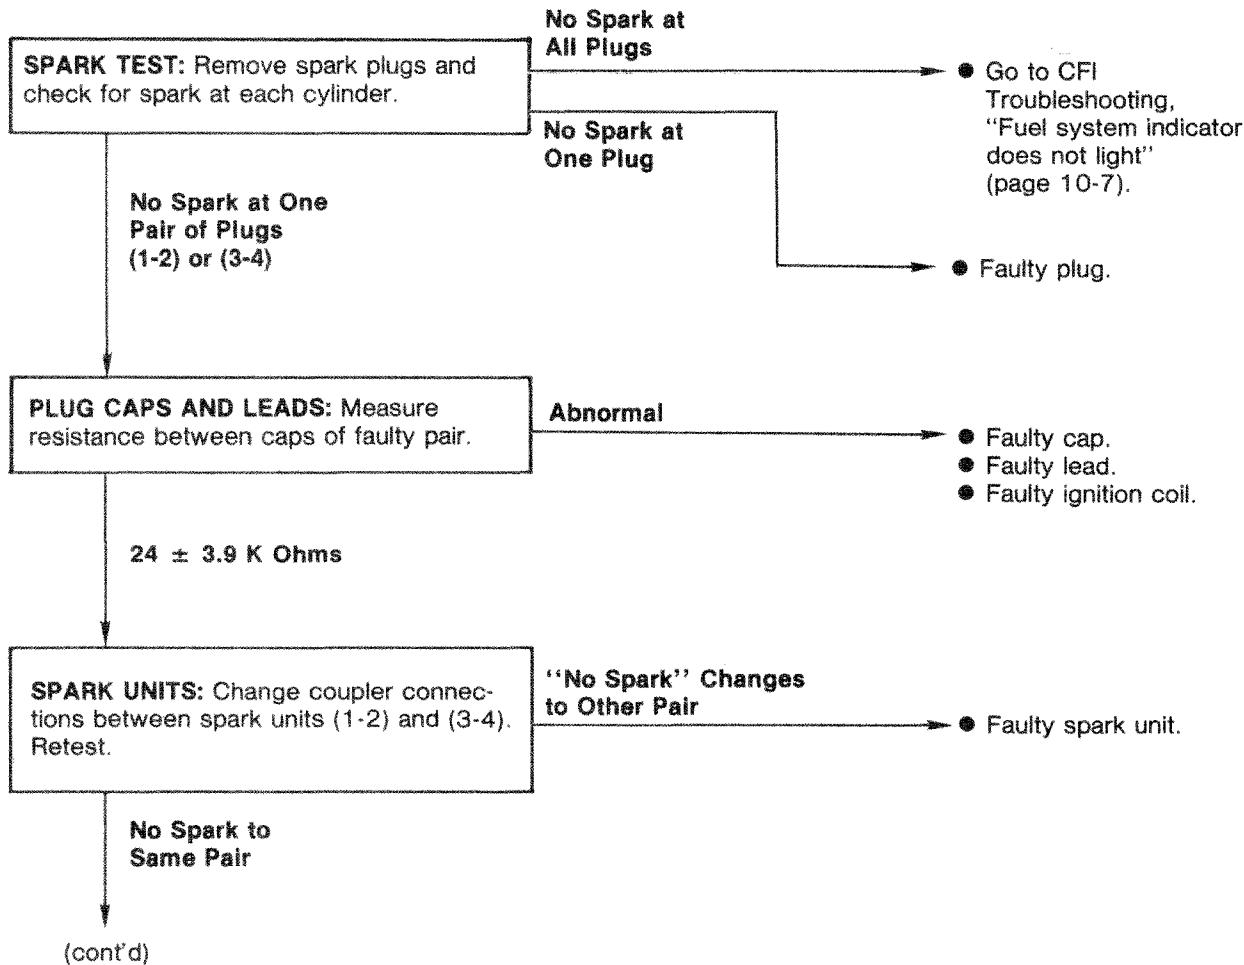

WARNING: Observe the following when performing a spark test:

- Keep open flames or sparks away from the work area.
- Purge the cylinder of residual gasoline by cranking 2 or 3 seconds with the engine stop switch and fuel valve OFF.

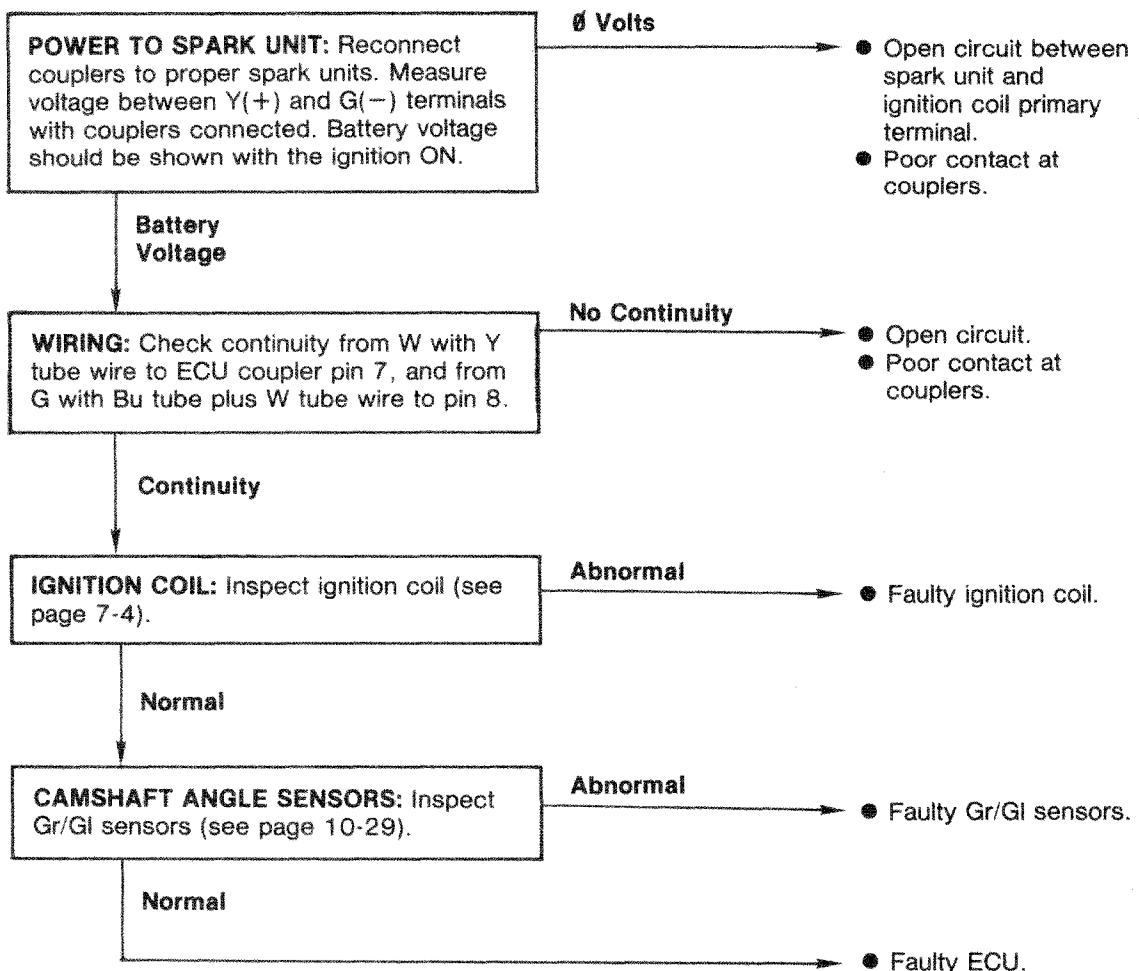

NOTES:

- Before beginning be sure that the battery is fully charged and all wires and cables are connected properly.
- Each pair of spark plugs (1-2, 3-4) has its own ignition circuit.

Engine does not start or is hard to start.

Ignition Troubleshooting (cont'd)

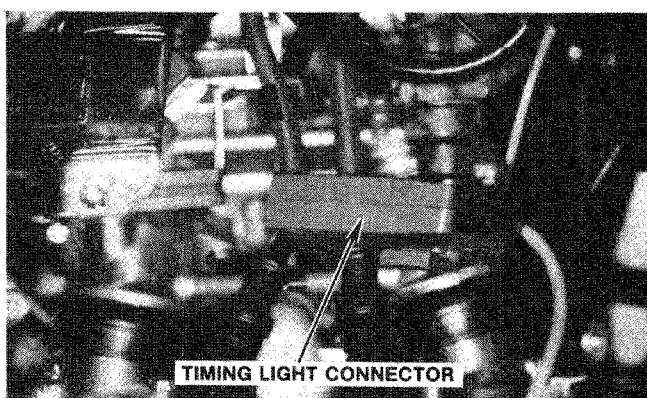

Ignition Timing

Inspection

NOTE: Inspect ignition timing while the engine is hot, because the ECU will compensate timing for a cold engine.

Remove the fuel strainer from the engine mount bracket without disconnecting the fuel lines.

Remove the timing inspection plug and install the timing inspection cap.

Connect a stroboscopic timing light to the No. 1 or No. 2 cylinder spark plug wire. Start the engine and let it idle.

Idle speed: 1000 ± 100 rpm

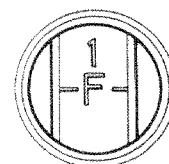

The timing is correct if the flywheel F1 mark aligns with the inspection cap center index mark at idle.

Timing advance is correct if when the engine speed is raised, the F1 mark moves up and disappears.

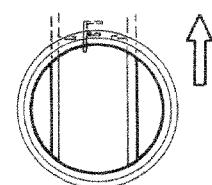

Connect the timing light to the No. 3 or No. 4 cylinder spark plug wire and repeat the procedure using the F2 mark.

If the timing is incorrect, check the PBR/PBL, Ns, 0th, NR/NL, and Tw sensors. If these sensors are OK, install a new ECU.

AT IDLE SPEED
($1,000 \pm 100$ RPM):

AT INCREASED ENGINE SPEED:

Ignition Ignition Coil

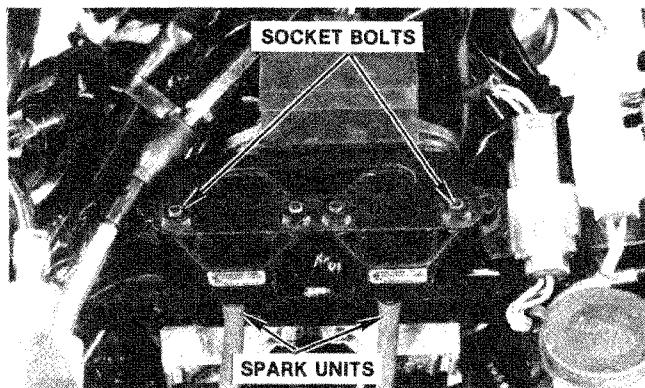

Removal

Remove the top compartment.

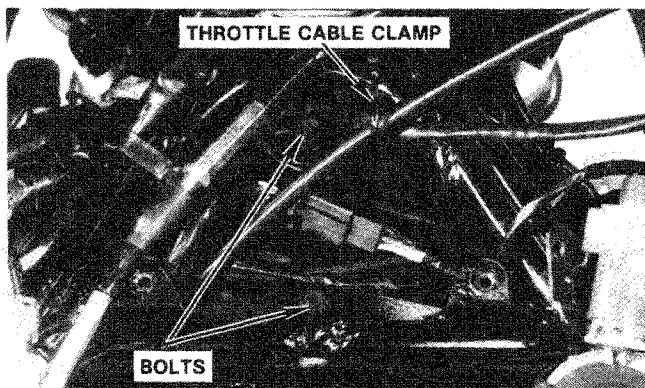

Remove the two socket bolts. Remove the PB sensor/fuel pump shut-off sensor together.

Remove the air cleaner case assembly.

Remove the mounting bolts. Remove both spark units.

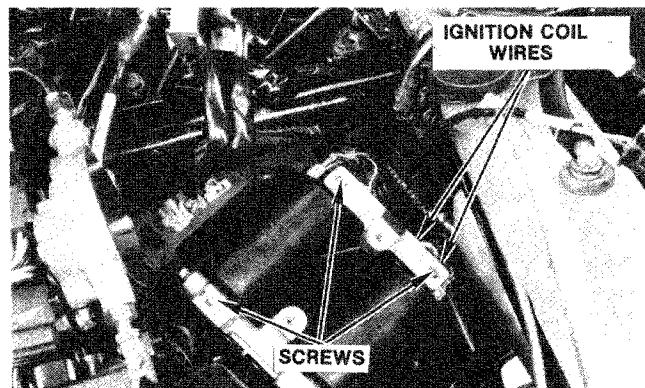

Remove the two bolts and the throttle cable guide. Pull the ignition coil toward the air cleaner.

Remove the ignition coil screws and disconnect the terminal wires. Remove the ignition coil.

NOTE: When installing the coils, the BI/W and Y/Bu wires go to the left coil (1-2). The BI/W and Bu/Y wires go to the right coil (3-4). Coil polarity has no effect on performance.

Inspection

See the base manual for ignition coil inspection.

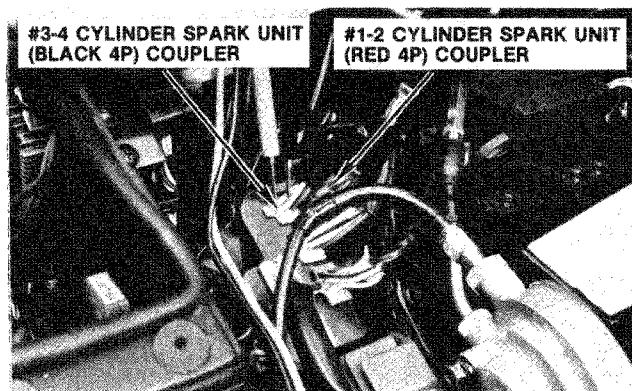

Spark Unit

Inspection

Remove the top compartment. Turn the ignition switch ON.

Measure the voltage between the coupler wires of both spark units, as described below.

Check for battery voltage between the coupler W (+) and G (-) wires.

If there is no voltage, disconnect the coupler and check for continuity between the Y harness lead, the ECU coupler No. 33 terminal, and the black 13P coupler Y lead on the rear fender. If there is no continuity, the wiring harness has an open.

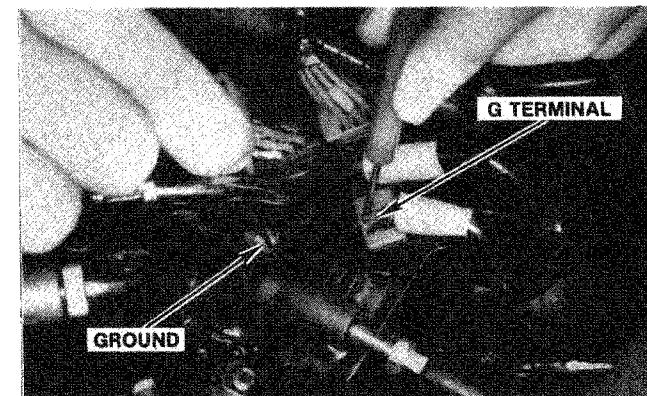

Check for battery voltage between the coupler BI/W (+) and G (-) terminals.

If there is no voltage, check for continuity between the 21P black coupler W terminal on the fuse box and the spark unit coupler BI/W terminal. If there is no continuity, the wiring harness has an open.

Check for battery voltage between the coupler Y (+) and G (-) terminals.

If there is no voltage, check for continuity between spark unit coupler G terminal and ground. If there is no continuity, the coupler G wire is open. If there is continuity, the spark unit is faulty.

(cont'd)

Ignition Spark Unit (cont'd)

Removal/Installation

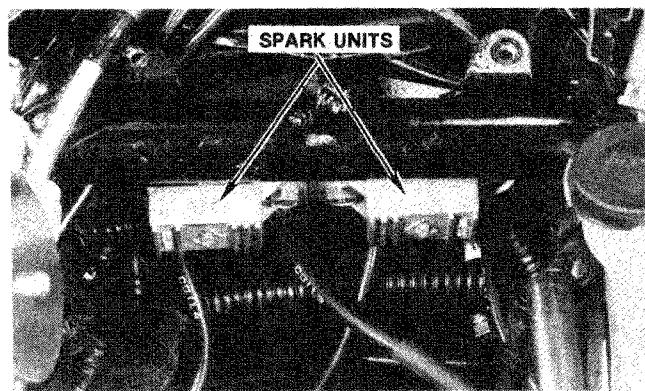

Remove the top compartment, air cleaner, and air cleaner case.

Remove the spark unit coupler.

Remove the bolt and spark unit.

NOTE: The No. 1-2 cylinder spark unit 4P coupler is red. The No. 3-4 cylinder coupler is black.

Install the spark units in the reverse order of removal.

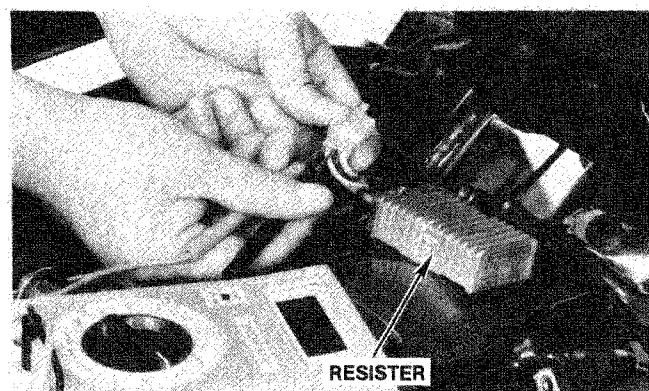

Spark Unit Resister

Inspection

Disconnect the coupler and measure resistance between the white and black wire terminals.

Resistance: 2.9- 3.2 ohms

If resistance is outside these limits, install a new resister.

Lights/Switches/Instruments

Turn Signal/Cornering Lights

System Diagram

Lights/Switches/Instruments

Front Brake Light Switch

Inspection

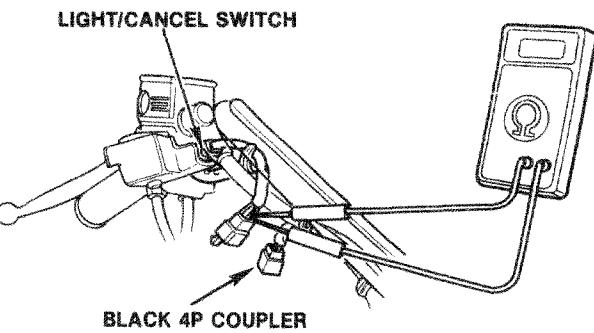

Disconnect the front brake light/cancel switch connector under the right handlebar.

Check continuity between G/Y and W/G wire terminals on the switch side coupler.

Lever released: No continuity

Lever pulled: Continuity

Check continuity at the switch terminals and replace the switch if continuity is abnormal.

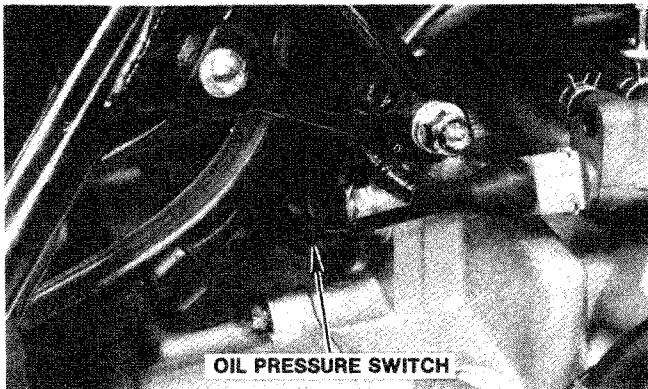

Oil Pressure Warning Switch

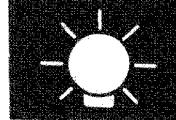

Installation

The oil pressure warning switch is behind the charcoal canister on the California model.

Torque: 12 N.m (9 ft-lb)

NOTE: Make sure the switch wire doesn't contact the clutch cable after installation.

Oil Pressure Sensor

Removal

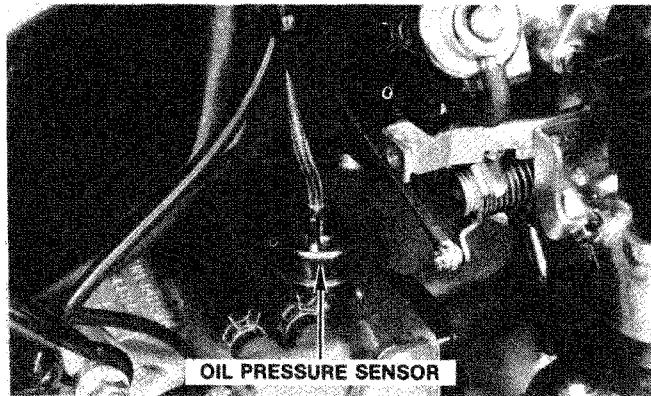

Disconnect the yellow 3P sensor coupler under the right side of the shelter.

Remove the air cleaner cover.

Release the wire from its two guides and pull the coupler through the gap between the frame and radiator neck.

NOTE: Be careful not to twist the sensor wire during removal and installation.

Remove the air vent hose, then the oil pressure sensor.

Installation

Apply sealant to the switch threads. Install and tighten the switch.

Torque: 12 N.m (9 ft-lb)

Connect the sensor coupler and air vent tube. Install the air cleaner cover.

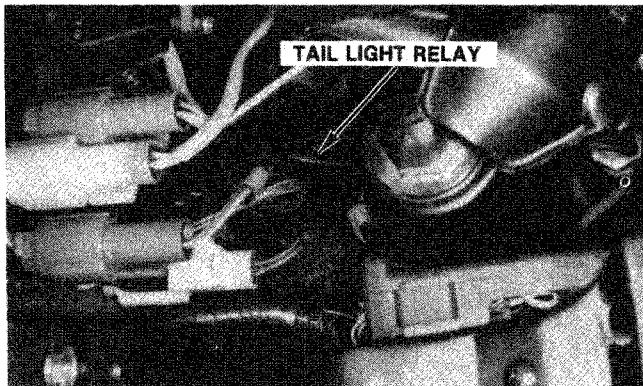

Tail Light Relay

Inspection

Remove the shelter.

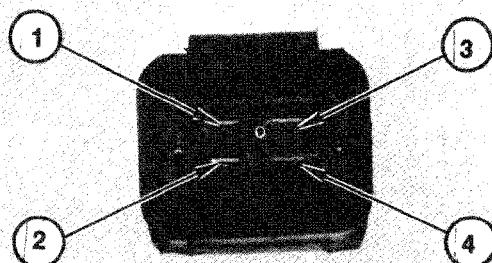

The relay is just to the left of the radiator cap. Remove the relay from the bracket and pull off the rubber cover.

Depress the catch on the coupler with a long screwdriver and pull the relay out.

Check for no continuity between terminals #1 and #2. If there is continuity, install a new relay.

Apply battery voltage across terminals #3 and #4 and check the continuity between #1 and #2. If there is no continuity, install a new relay.

Lights/Switches/Instruments

Handlebar Switches

Turn Signal Switch

Remove the left side fairing pocket and shelter.

Inspect at the black and brown 9P couplers behind the rubber cover.

Test for continuity between the color coded wires.

CFI System

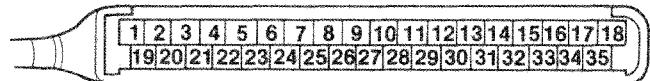

Service Information

- Disconnecting fuel lines: Turn the ignition switch OFF when fuel lines are separated. Install new O-rings and sealing washers during reassembly.
- Measuring outputs at coupler pins: Insert the tester probes from behind the coupler pins to avoid bending or prying them open. Be careful not to short out pins.
- Disconnecting a coupler or connector: Turn the ignition switch OFF. Positive (+) and negative (-) sides are so marked. Do not remove waterproof grommets from the couplers.

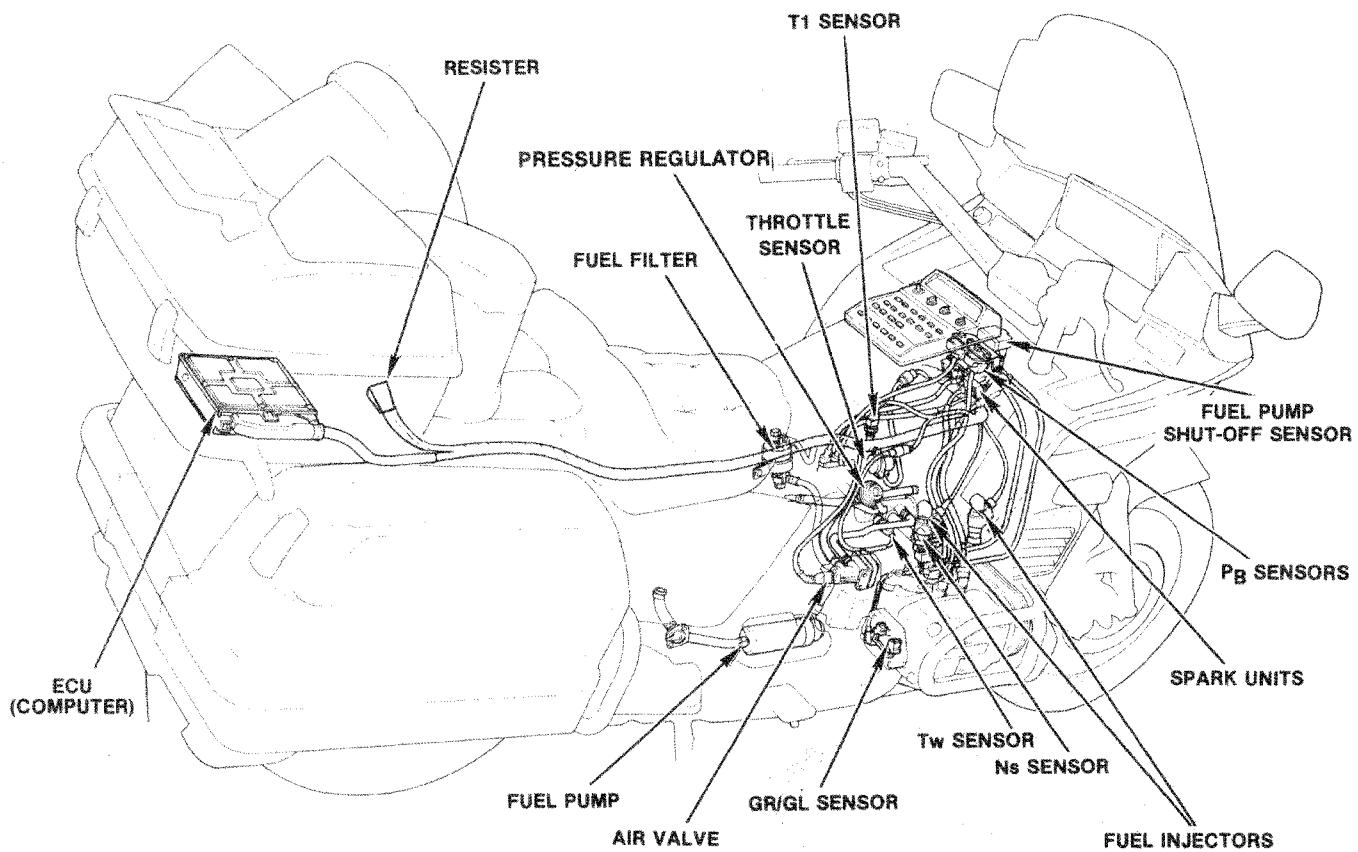

Fuses/Relays

ECU Coupler Pin Numbers

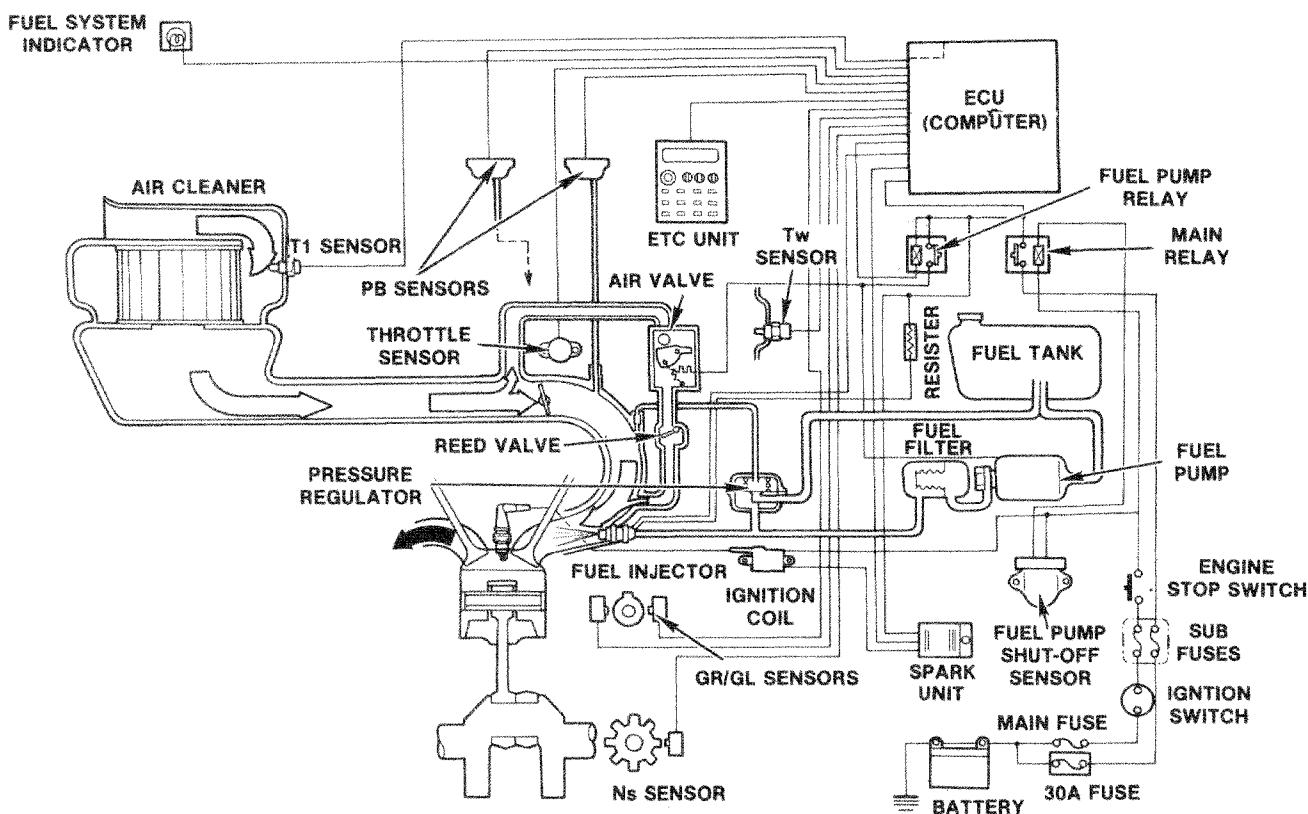

Parts Location

System Diagram

Parts Functions

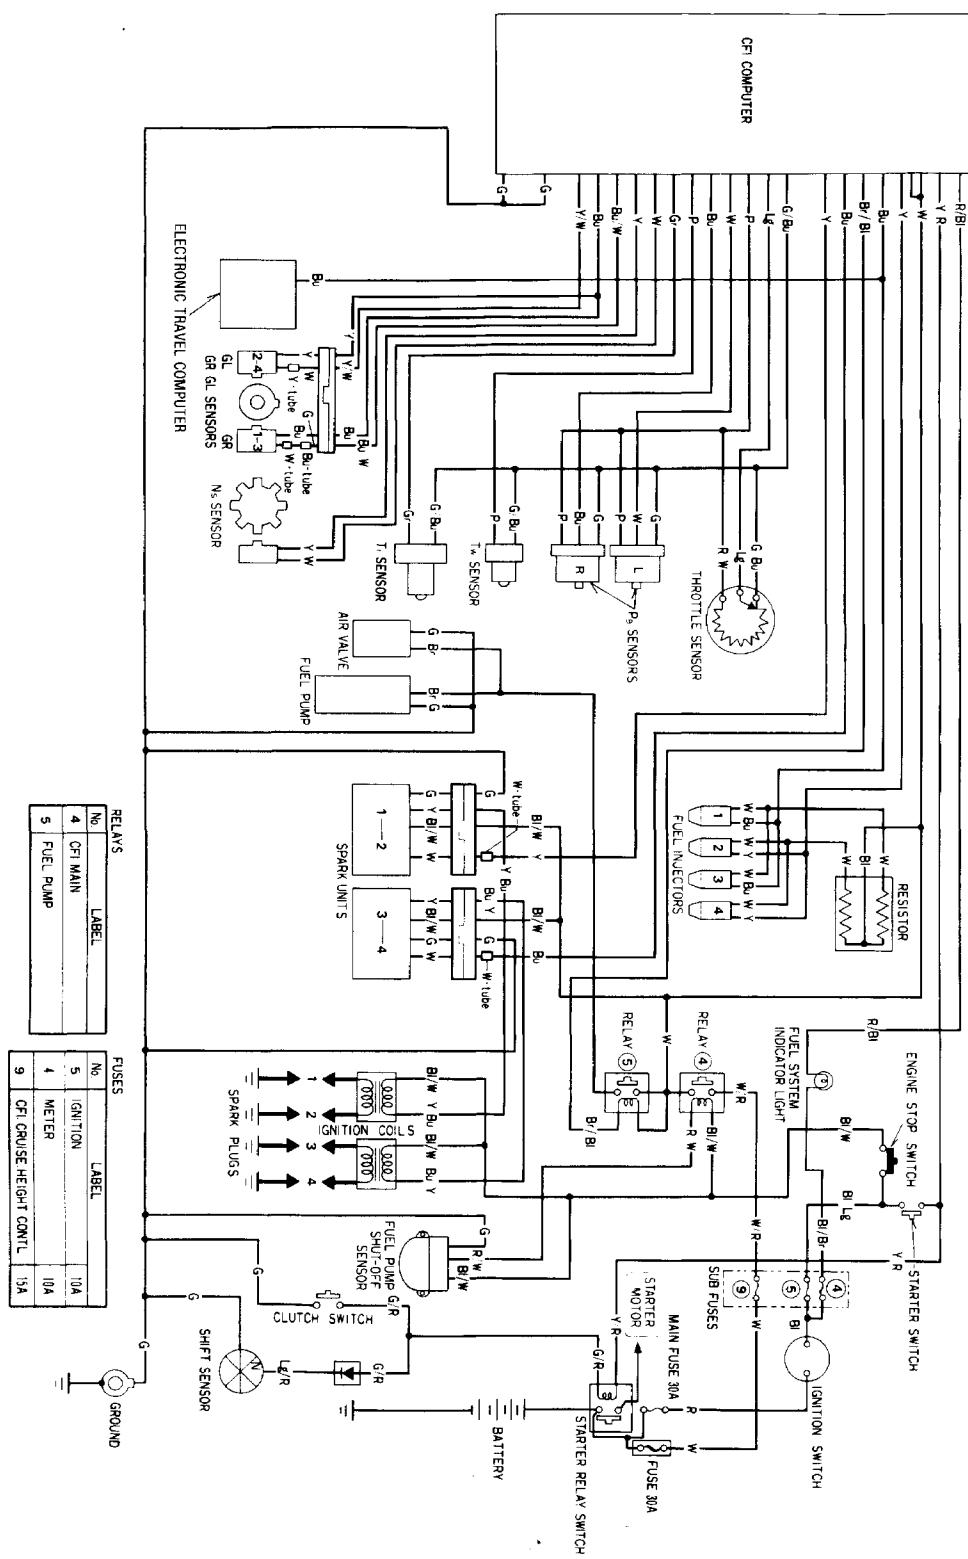

Part Name	Function
Air temperature sensor (T_1)	To detect intake air temperature and send signals to micro computer.
Pressure sensors (P_{BR}/P_{BL})	To detect right and left intake pipe pressure and send signals to micro computer.
Throttle sensor (0th)	To detect opening angle of throttle and send signals to micro computer.
Coolant temperature sensor (T_W)	To detect coolant temperature and send signals to micro computer.
Crankshaft angle sensor (Ns)	To detect variations of crankshaft speed and to send signals to the micro computer. Micro computer controls ignition timing and fuel injection volume accurately.
Camshaft angle sensor (GR/GL)	To detect specific angular position of crankshaft and send signals to micro computer. Micro computer then determines fuel injection and ignition timing for both cylinders.
Fuel pump relay	To control fuel pump power supply according to voltage from the micro computer.
Main relay	To turn computer power supply on and off depending on how ignition switch or engine stop switch is operated. Entire function of CFI system is stopped when supply of power to micro computer is shut down.
Fuel pump shut-off sensor	To turn main relay off when motorcycle is leaned over 60° on either side, stopping the function of the CFI system.
Computer unit	<ul style="list-style-type: none"> ● Receives signals from various sensors to get fuel into cylinders in correct amount and at the right time through the injectors. ● Determines optimum ignition timing based on signals sent from various sensors. Also controls ON/OFF of ignition current. ● Controls fuel pump. ● Indicates faulty system or components through self-diagnosis system and offers fail-safe functions.

CFI System

CFI Self-Diagnostic System

The computer memory includes some fail-safe functions and a self-diagnosis program with a series of LED's on the computer housing side. These indicators light to indicate problems in the systems and components listed below.

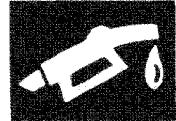

The system includes a LED self-checking function. The five LED's and the fuel system warning light should remain ON for about 1.5 seconds after the ignition switch is turned ON. The LED's can be inspected without removing the computer from its mount.

: Blinking : On : Off

DISPLAY 3 2 1 0 W	LOCATION	PROBLEM	FAIL-SAFE FUNCTION
	PBR sensor	• Open circuit • Shorted signal wire	PBL sensor output is used. When PBR sensor is faulty, Ne-Oth map is used for both injection and ignition timing.
	PBL sensor	• Open circuit • Shorted signal wire	PBR sensor output is used. When PBL sensor is faulty, Ne-Oth map is used for controlling fuel injection and ignition timing.
	Throttle sensor	• Open circuit • Shorted signal wire	Ne-Ps map is used for controlling fuel injection and ignition timing. When Ps sensors are also faulty, fuel discharge duration and ignition timing are both fixed.
	ECU (P1 sensor)	• Faulty ECU (P1 sensor)	P1 is fixed to 760 mm (30 in) Hg.
	T1 sensor	• Open circuit • Shorted signal wire	T1 is fixed to 25°C (77°F).
	Tw sensor	• Open circuit • Shorted signal wire	Tw is fixed to 85°C (185°F)
	#2, 4 cylinder injectors	• Open or short circuit (NOTE 1) (NOTE 2)	Fuel injection and ignition timing are both stopped.
	#1, 3 cylinder injectors	• Open or short circuit (NOTE 1) (NOTE 2)	Fuel injection and ignition timing are both stopped.
	Ns sensor	• Open circuit • Shorted signal wire (NOTE 1)	Fuel injection and ignition timing are both stopped.
	Gr sensor	• Open circuit • Shorted signal wire (NOTE 1)	Normal fuel injection and ignition timing control occur on Gr signals. When both Gr and Gs sensors are faulty, fuel injection and timing control are stopped.
	Gs sensor	• Open circuit • Shorted signal wire (NOTE 1)	Normal fuel injection and timing control are done by signals from Gs sensor. When both Gr and Gs sensors are faulty, fuel injection and timing control are stopped.

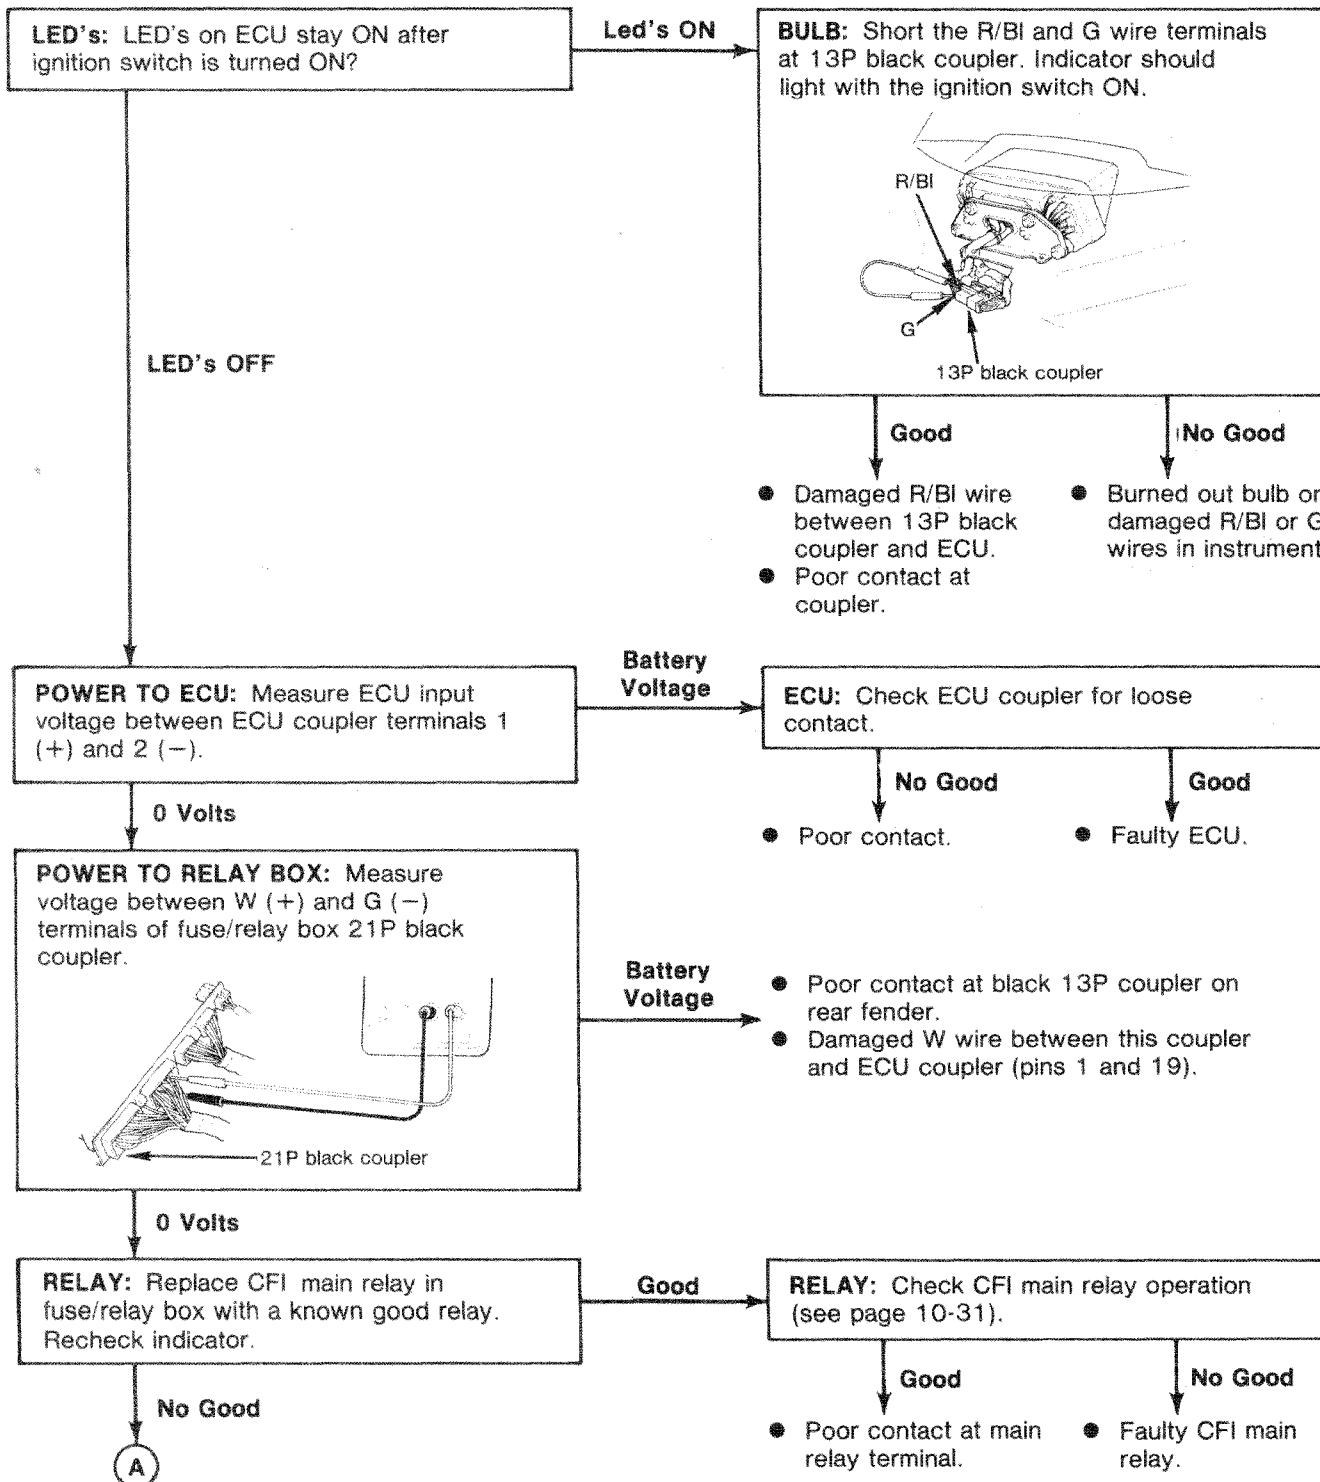

NOTES:

1. LED indicators for faulty injectors, open circuit, and Ne, NR/NL sensors will turn off when the ignition switch is turned OFF, and not relight until the engine is re-started.
2. Indicators for injectors faulty by open circuit will light only when both injectors in either bank fail simultaneously. Indicators will light, however, for a single injector faulty by a short circuit.
3. LED's will blink alternately when indicating more than one problem.

Troubleshooting

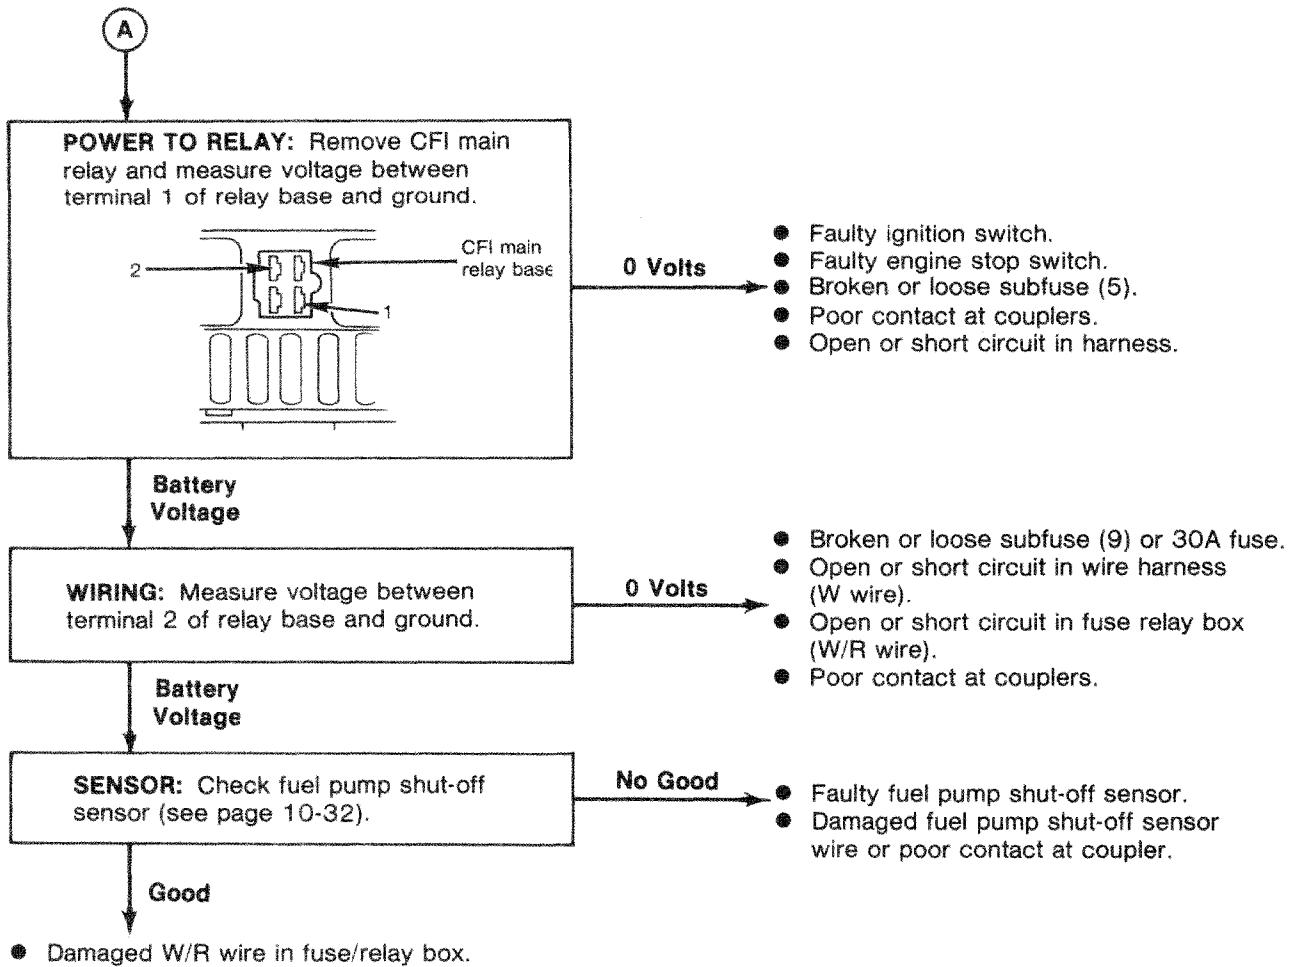

Fuel system indicator does not light (while other indicators are lit).

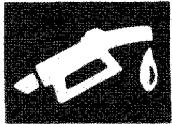

(cont'd)

CFI System

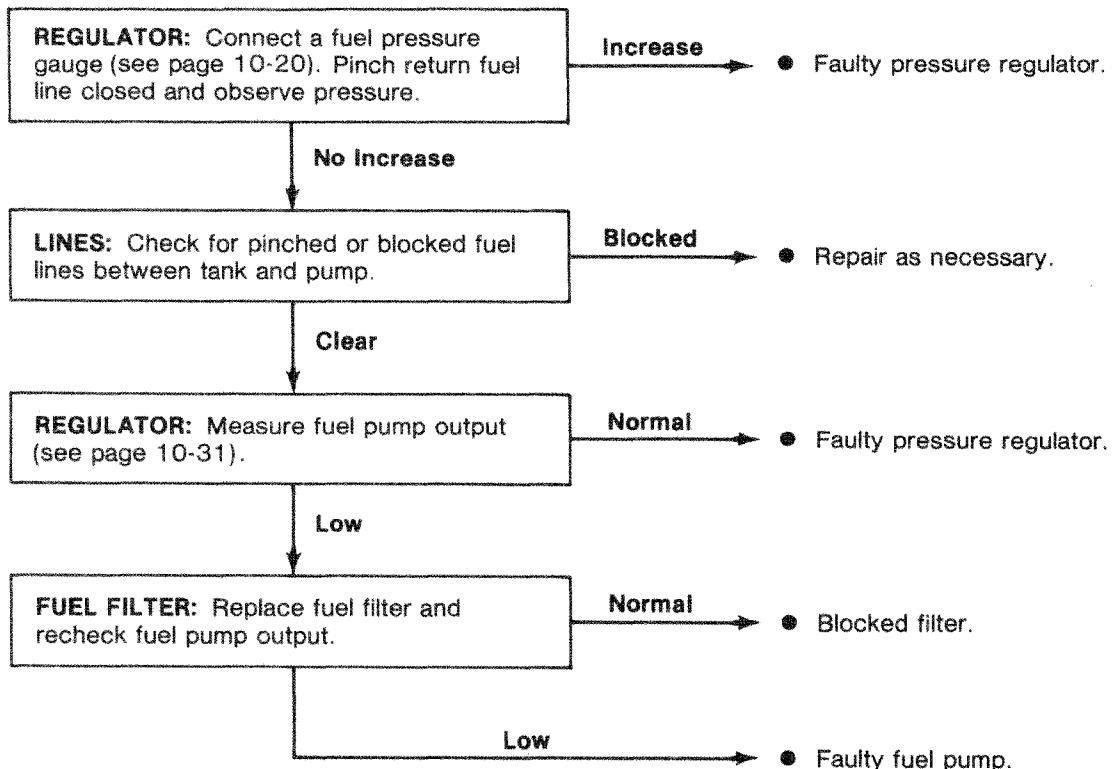

Troubleshooting (cont'd) —

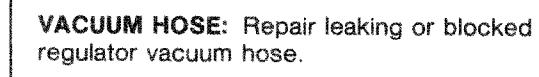

goldwingdocs.com

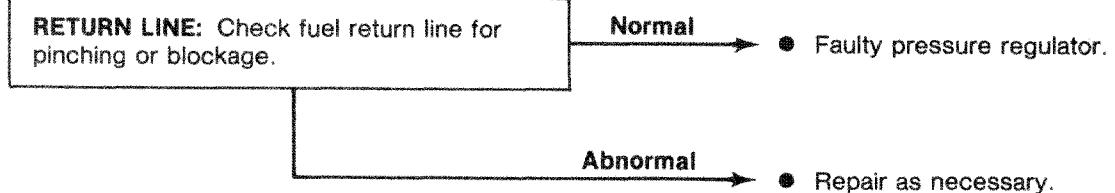

Low fuel pressure (engine OFF).

Abnormal fuel pressure (only at idle).

High fuel pressure (engine OFF).

(cont'd)

CFI System

Troubleshooting (cont'd)

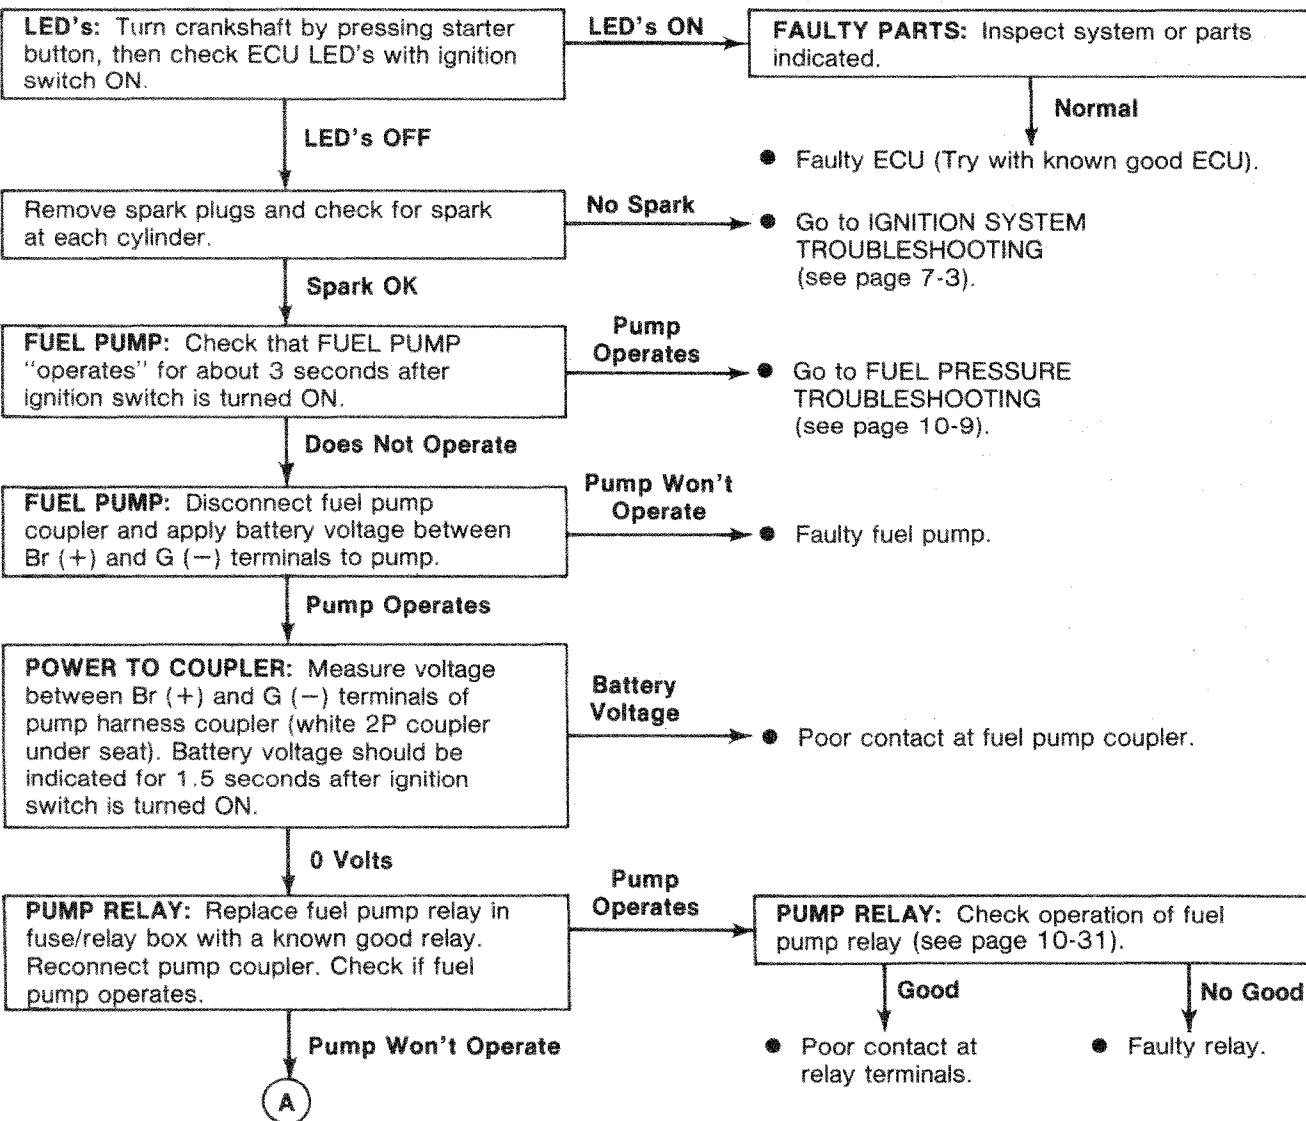

Engine does not start or is hard to start

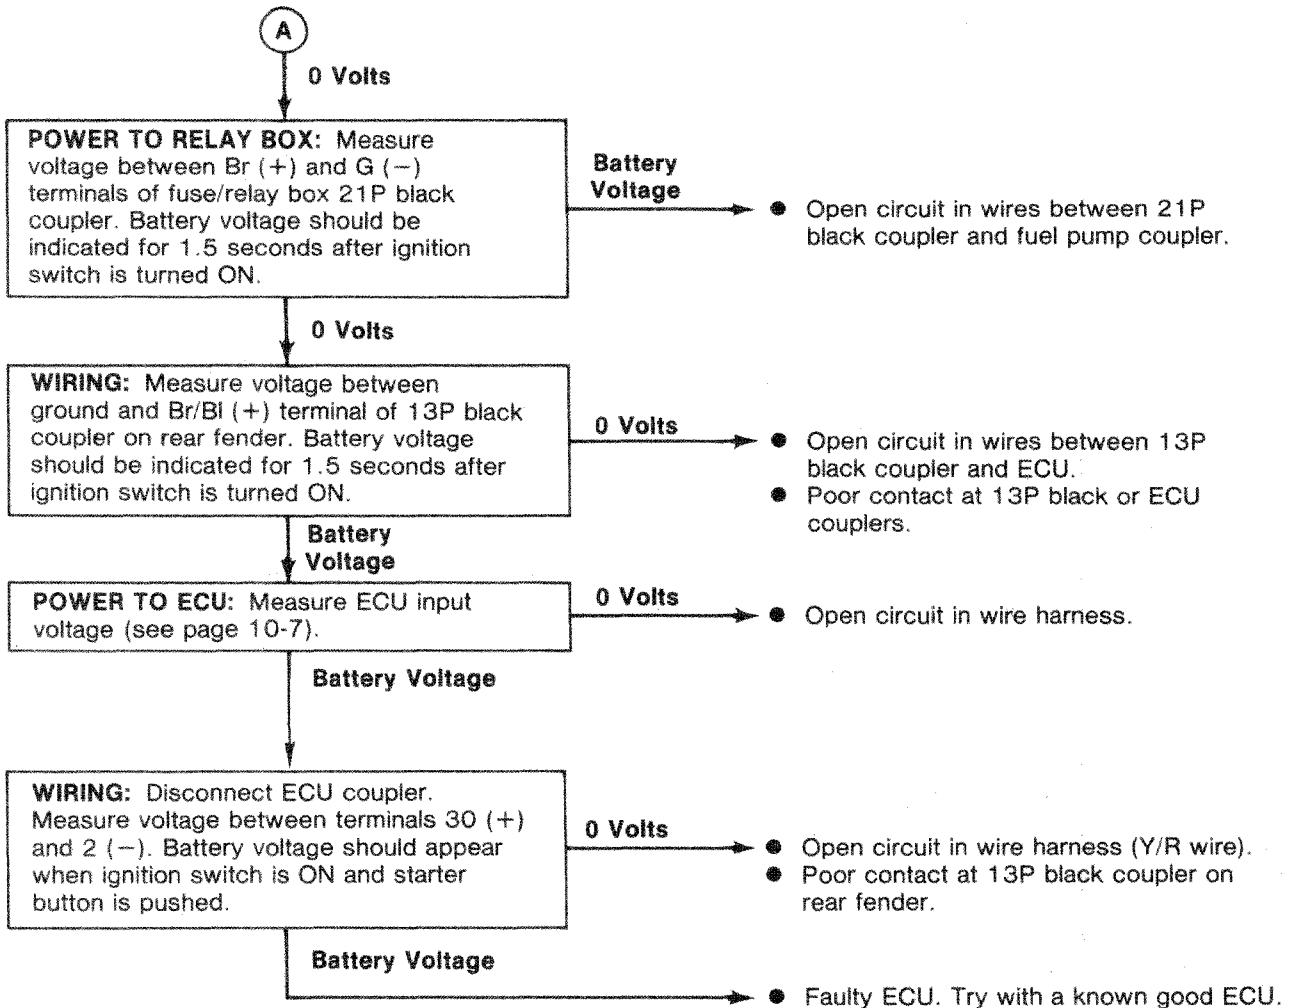

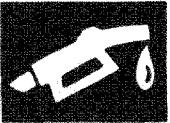

Check the following items before using this chart:

- 1) Fuel level.
- 2) Fuel valve ON.
- 3) Ignition switch ON.
- 4) Fuel pump shut-off sensor ON.
- 5) Starting motor is in good condition.
- 6) Crankshaft is turned by starting motor.
- 7) Spark plug condition.
- 8) Neutral indicator is ON.
- 9) Fuel system indicator comes on for 1.5 seconds when ignition switch is turned ON.

WARNING: Observe the following when performing a spark test:

- Keep open flames or sparks away from the work area.
- Purge the cylinder of residual gasoline by cranking 2 or 3 seconds with the engine stop switch and fuel valve OFF.

(cont'd)

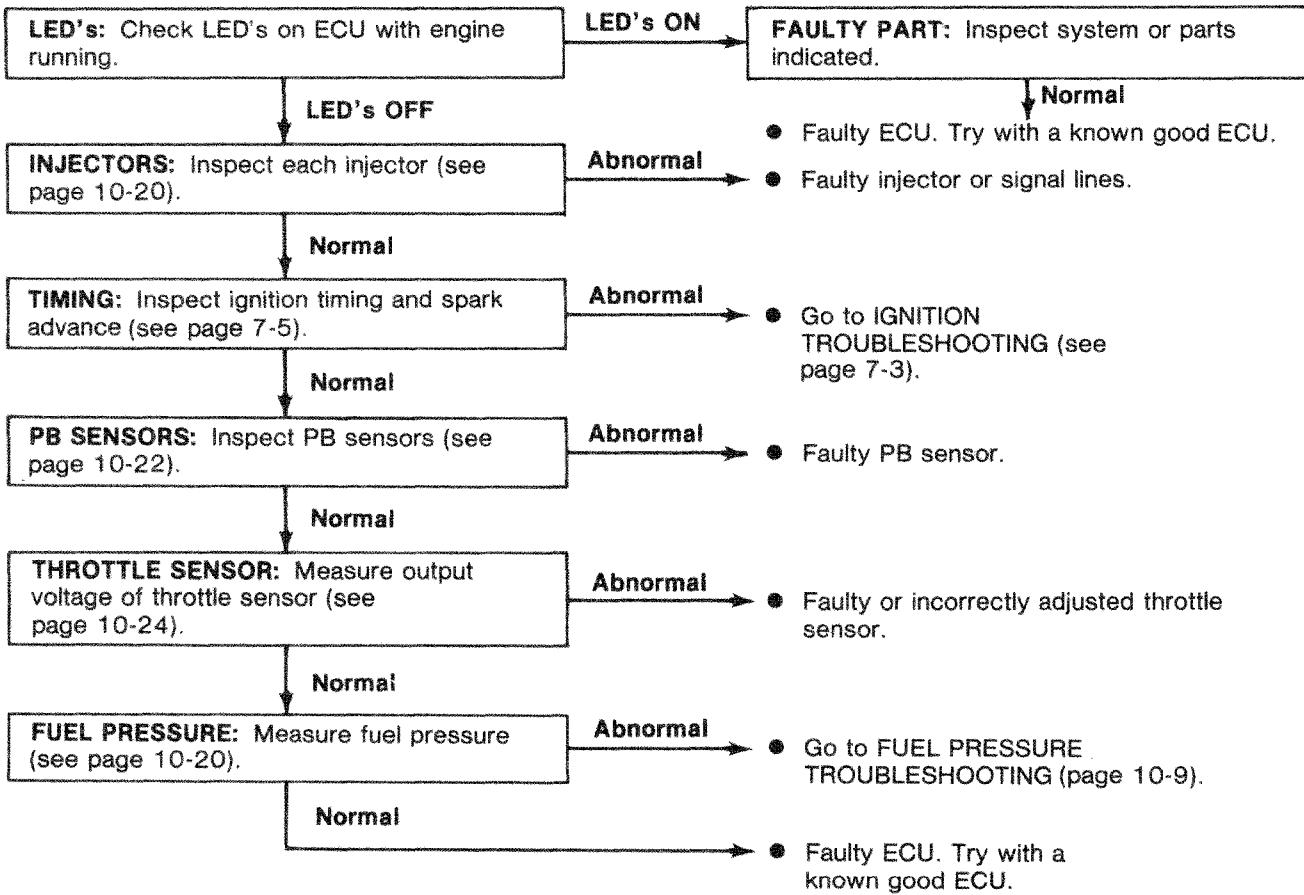

CFI System

Troubleshooting (cont'd)

Loss of power/poor acceleration.

Check the following items before using this chart:

- 1) Fouled or clogged air cleaner.
- 2) Tire pressures.
- 3) Brake dragging.
- 4) Spark plugs.
- 5) Cylinder compression.

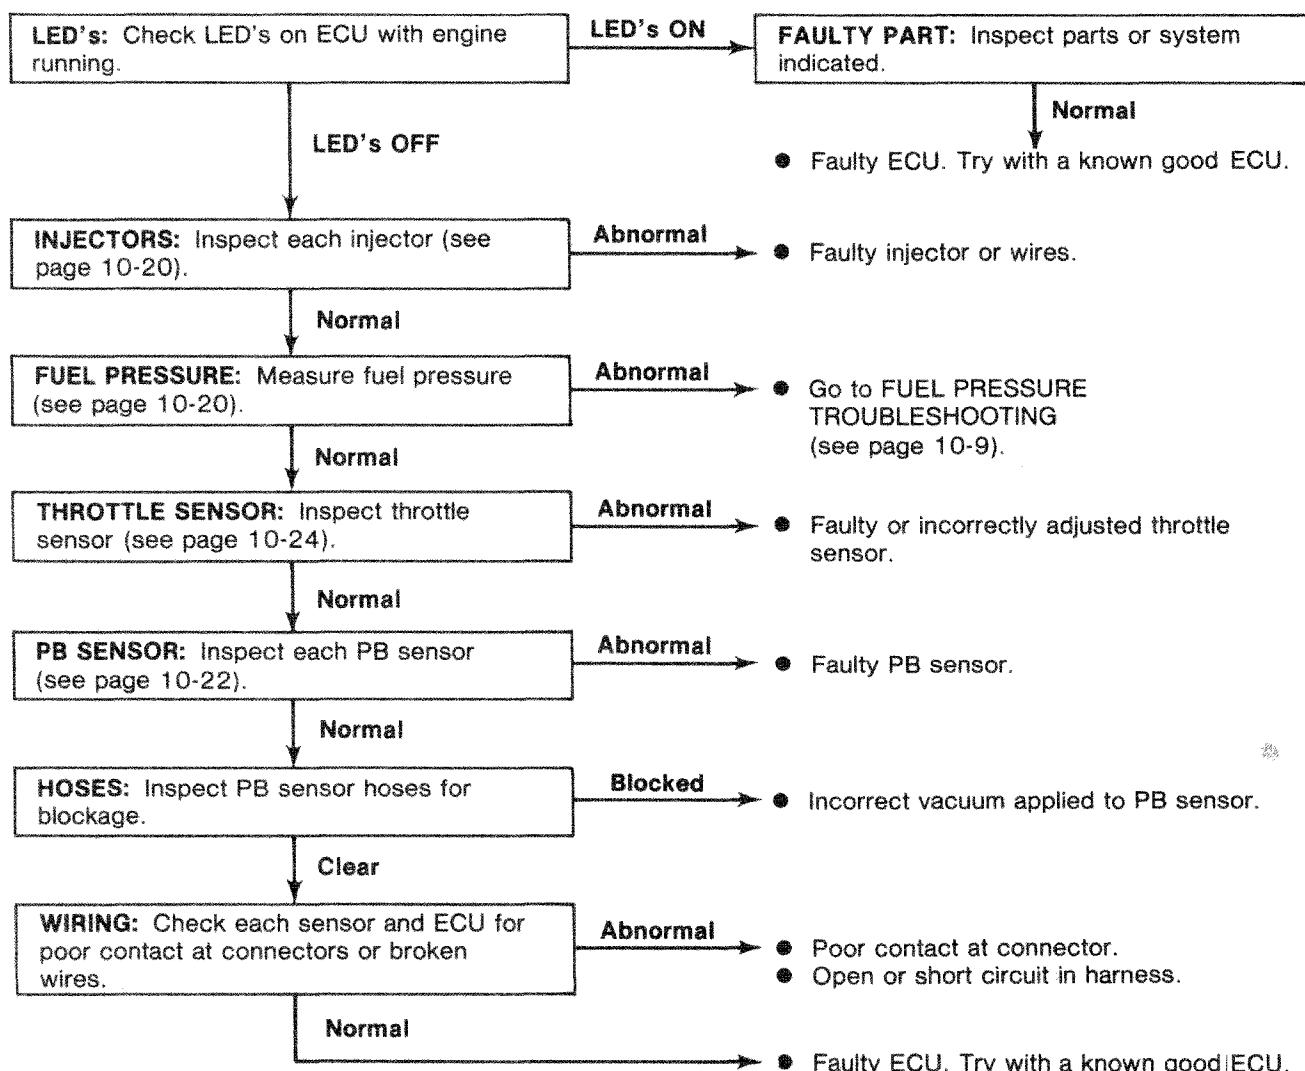

Poor performance at medium and high speeds.

Check the following items before using this chart:

- 1) Clogged air cleaner.
- 2) Spark plugs.
- 3) Cylinder compression.
- 4) Routing of sensor tubes.
- 5) Loose battery terminals.
- 6) Poorly connected ground.
- 7) Clogged pressure regulator tubes.

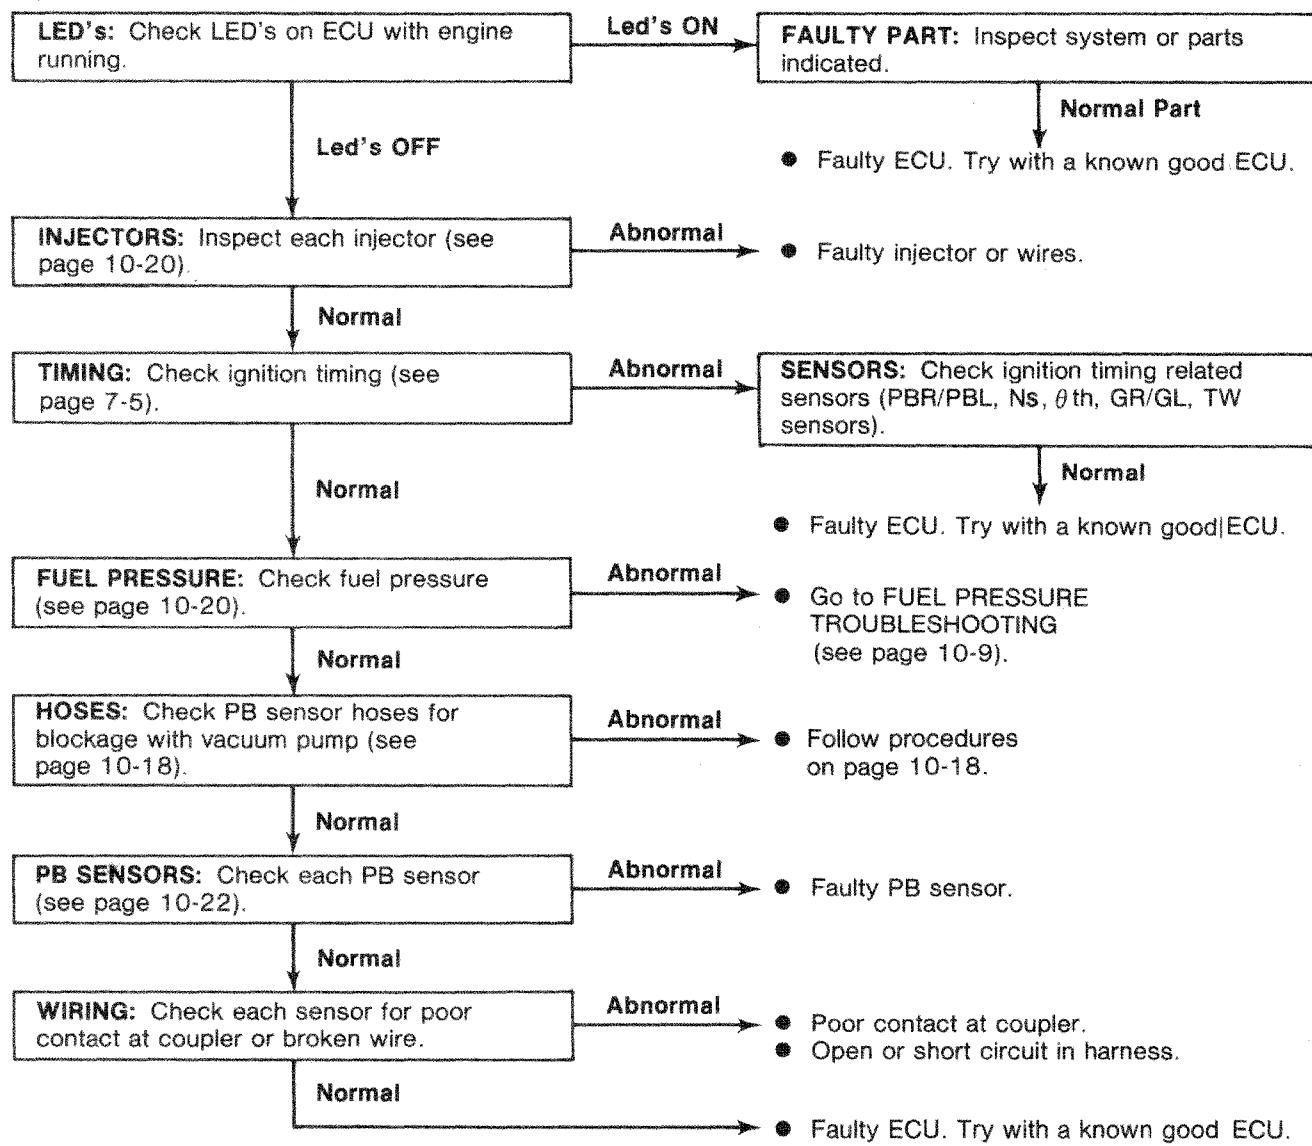

(cont'd)

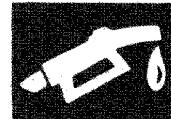

CFI System Troubleshooting (cont'd)

Afterfire

Check the following items before using this chart:

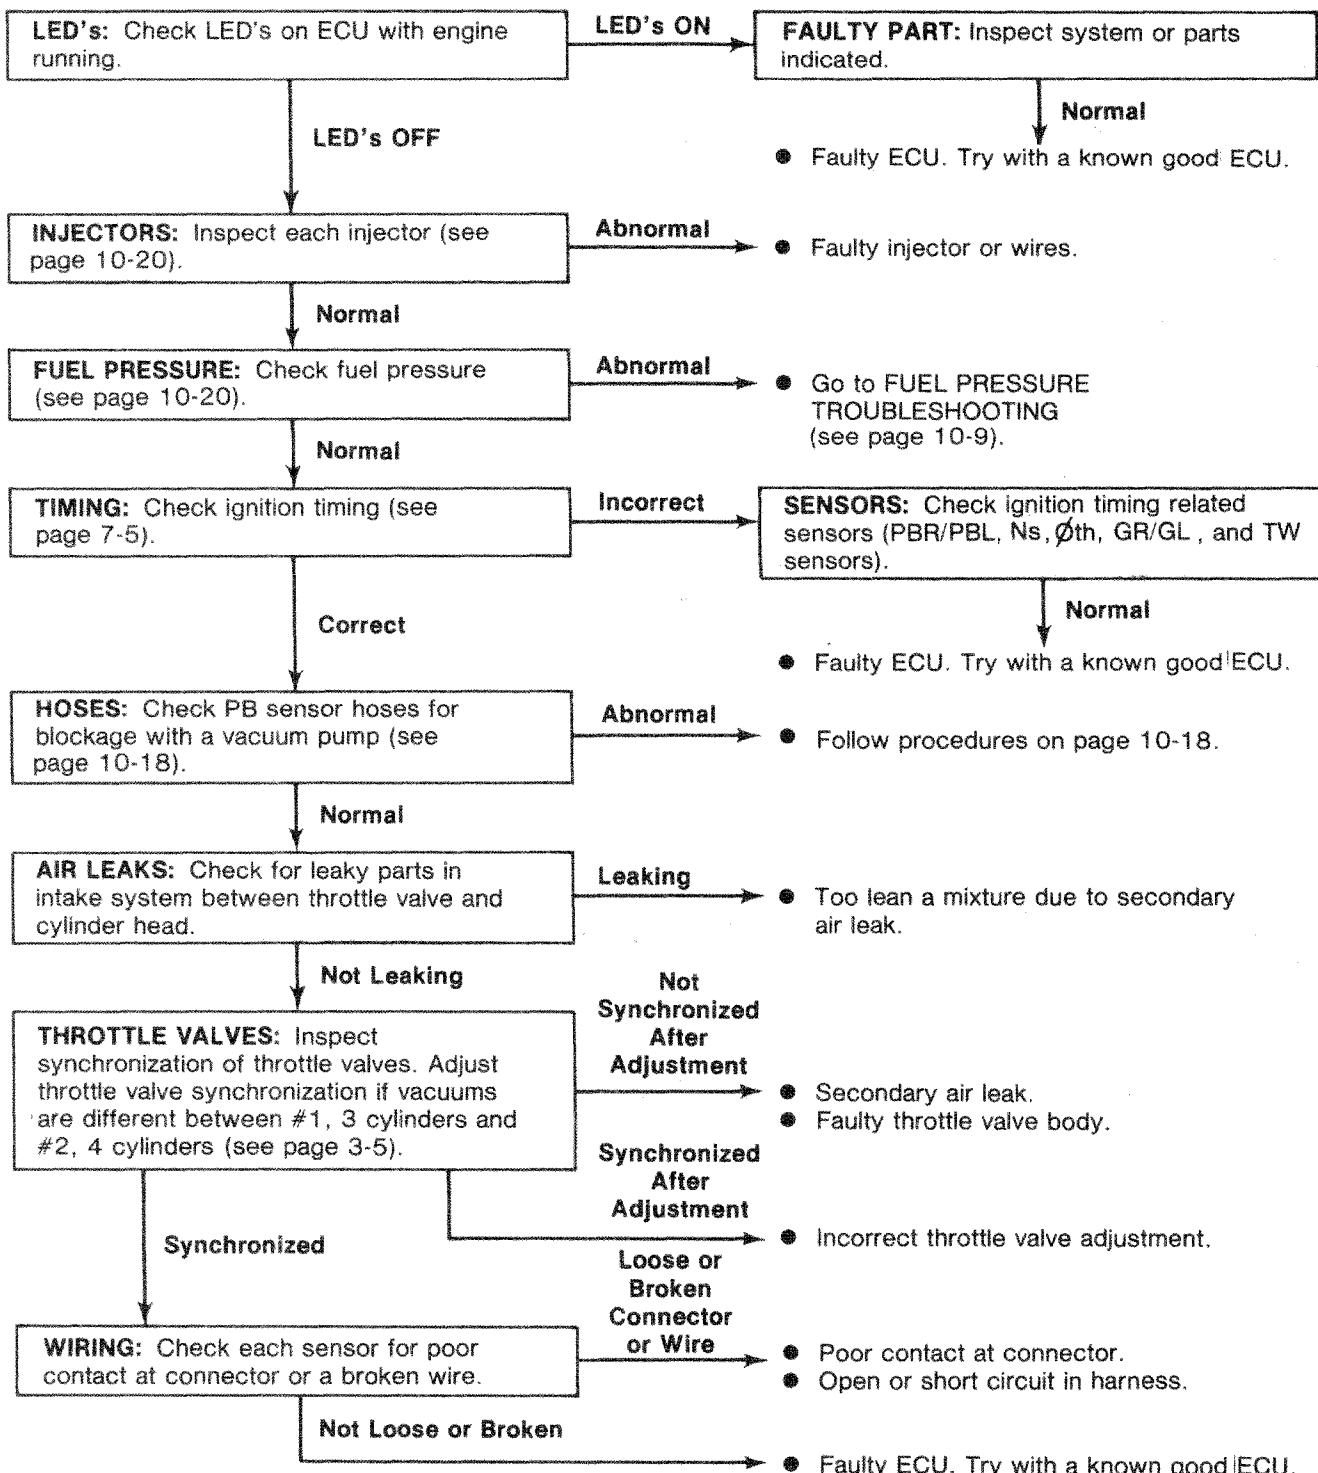

- 1) Spark plugs.
- 2) Secondary air supply system.
- 3) Secondary air leaking at intake system.
- 4) Loose exhaust pipe joints.

Backfire

Check the spark plugs before using this chart.

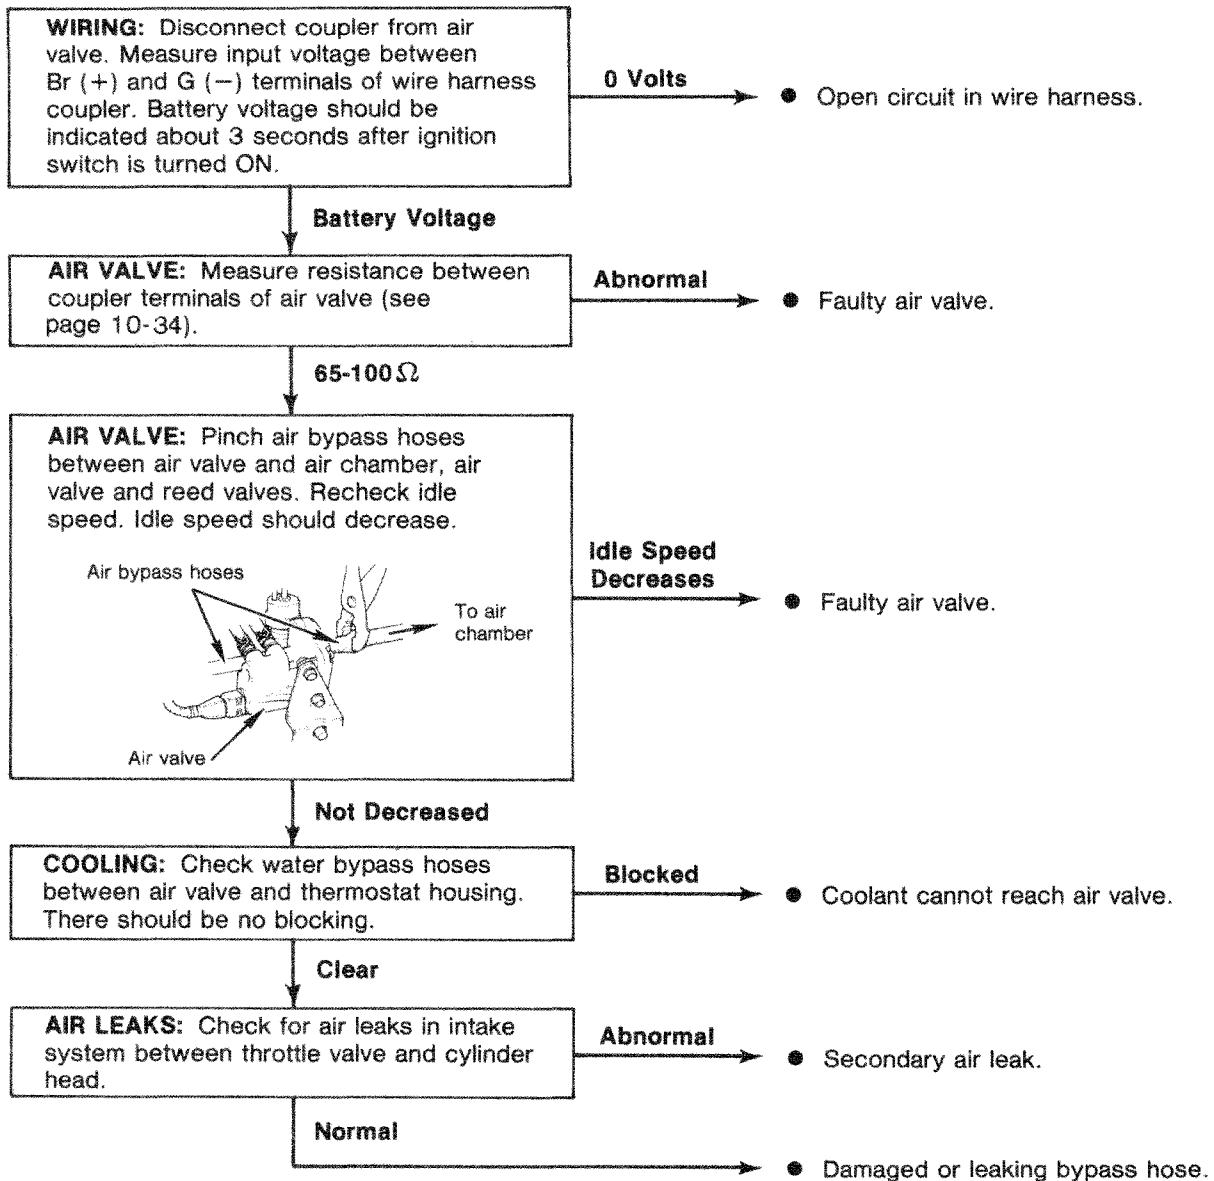

(cont'd)

CFI System

Troubleshooting (cont'd)

Fast idle speed does not decrease when warm.

NOTE: Warm engine up to normal operating temperature before inspecting.

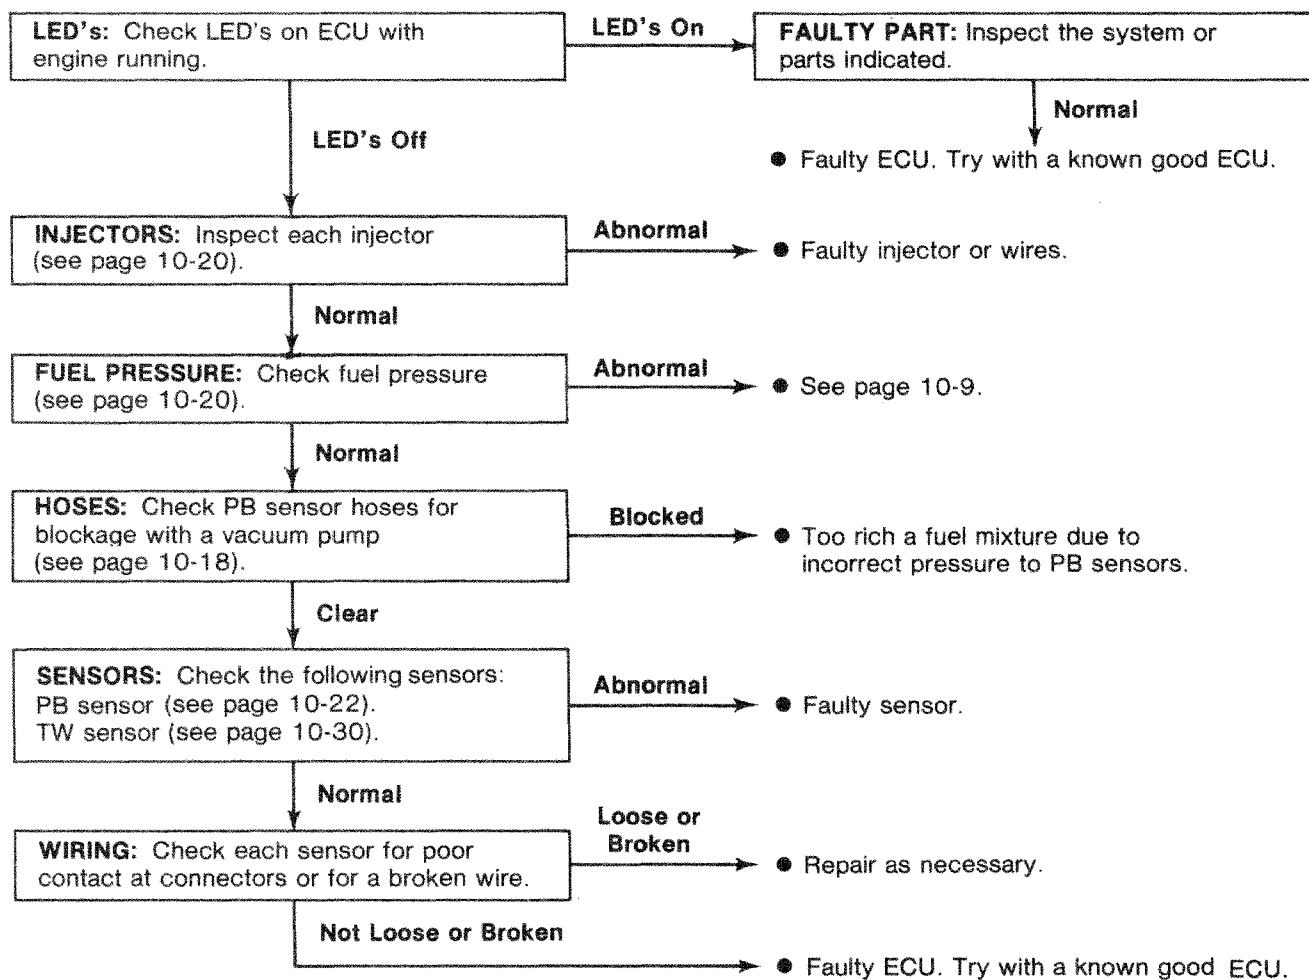

Excessive black smoke.

Note: Check the following items before using this chart:

- 1) Engine is at normal operating temperature.
- 2) Spark plug condition.

(cont'd)

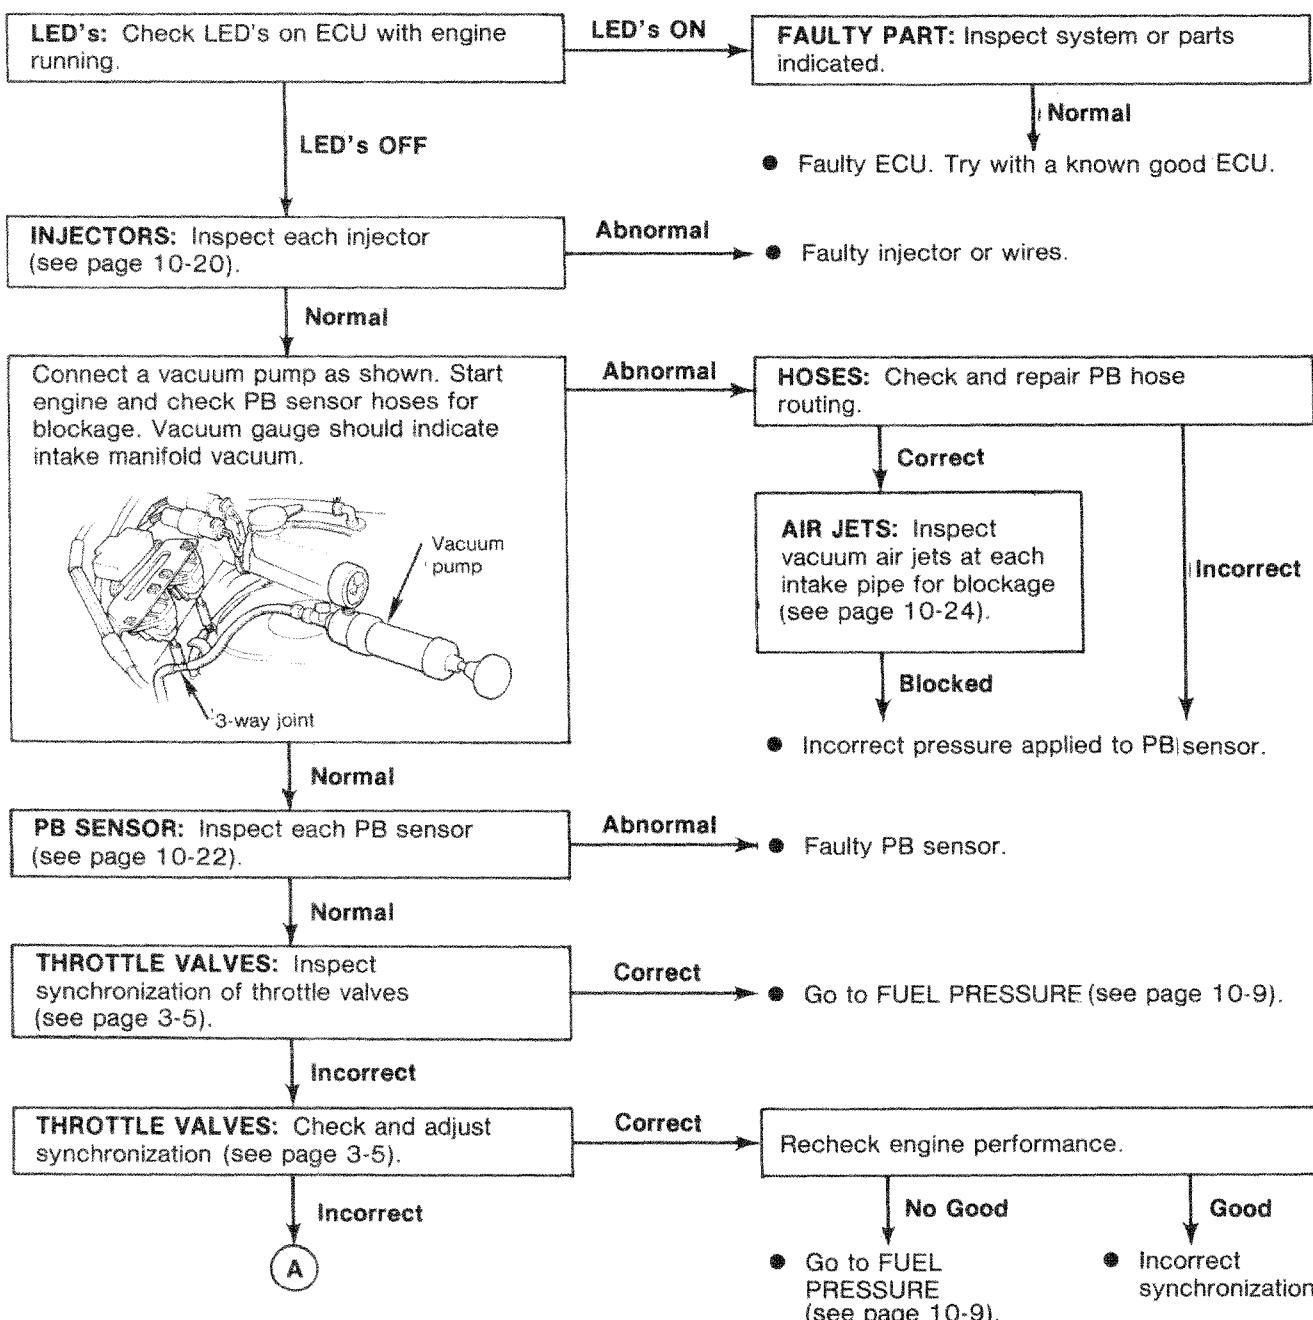

CFI System

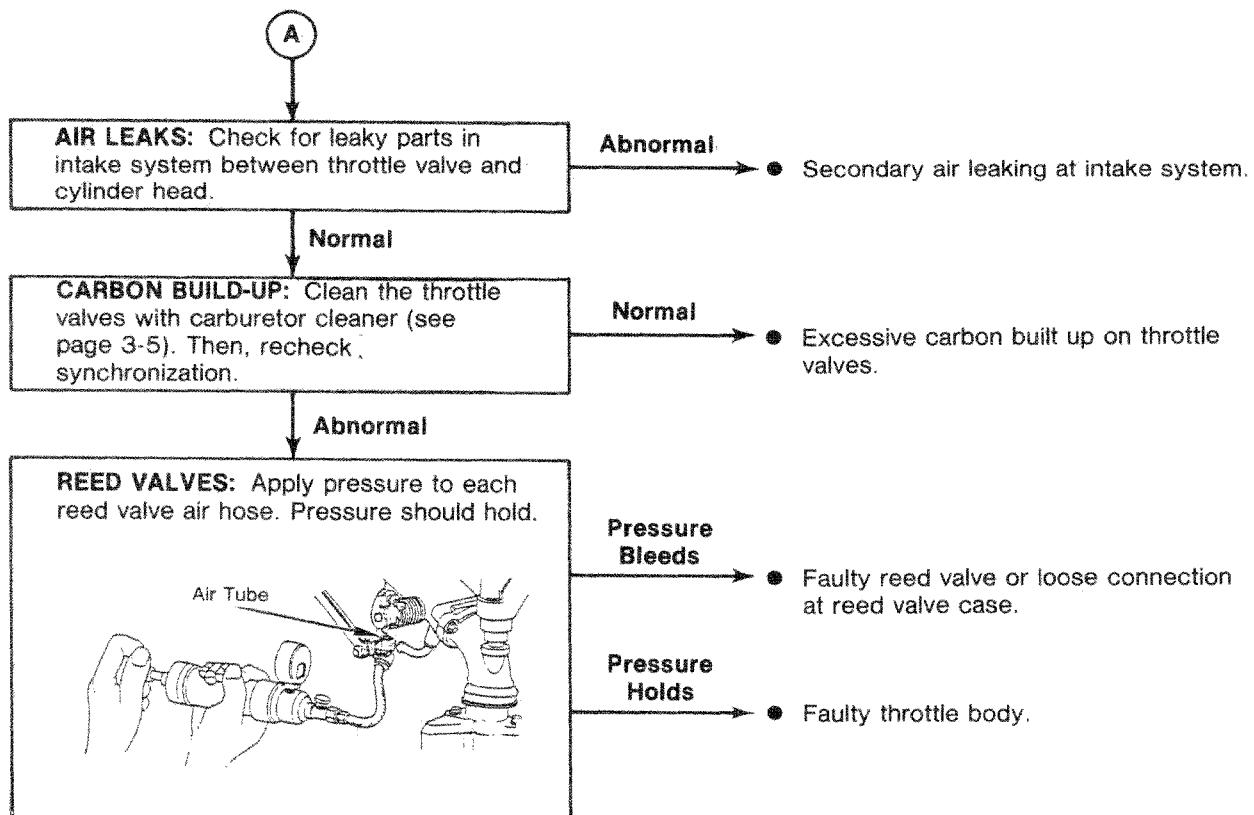

Troubleshooting (cont'd)

Poor performance at low and idle speeds.

Check the following items before using this chart:

- 1) Spark plugs.
- 2) Idle speed.
- 3) Cylinder compression (valve clearance).
- 4) Fouled or clogged air cleaner.
- 5) Loose battery terminals.
- 6) Poor ground contact (engine side).

CFL System

Fuel Pressure Inspection

With the engine stopped, turn the ignition switch ON. You should hear the fuel pump operating for about three seconds.

NOTE: Fuel pressure can also be felt by pinching the fuel return hose between your fingers.

Remove the right injector cover and right fairing lower cover.

WARNING: The fuel line is pressurized. Place a shop towel around the check plug and remove it slowly from the fuel delivery pipe.

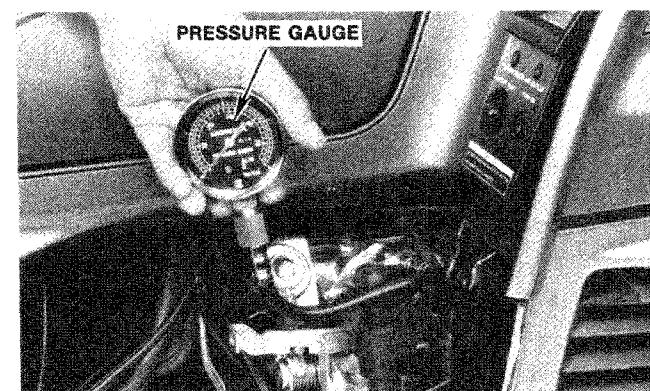

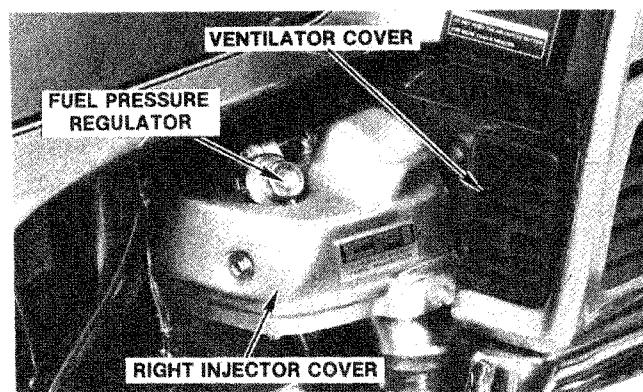

Connect a fuel pressure gauge and measure fuel pressure with the ignition switch ON.

Engine stopped: 2.4-2.7 kg/cm² (34-38 psi)

Idle: 2.0-2.4 kg/cm² (28-34 psi)

If pressure is not within specification, replace the fuel pressure regulator.

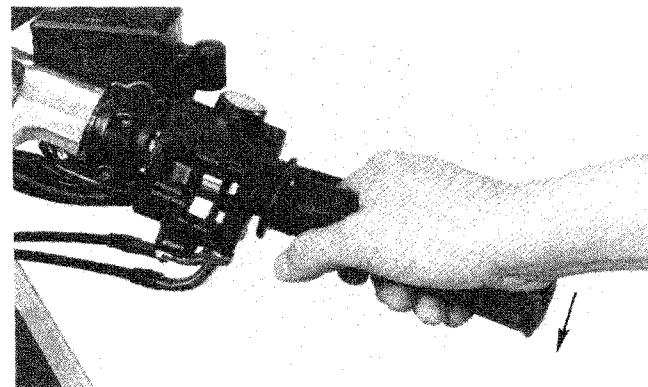

NOTE: Install a new aluminum washer when you reconnect the fuel line.

Fuel Injectors

Operation Inspection

With the engine stopped, turn the ignition switch ON and quickly open the throttle. You should hear the injector 'click'.

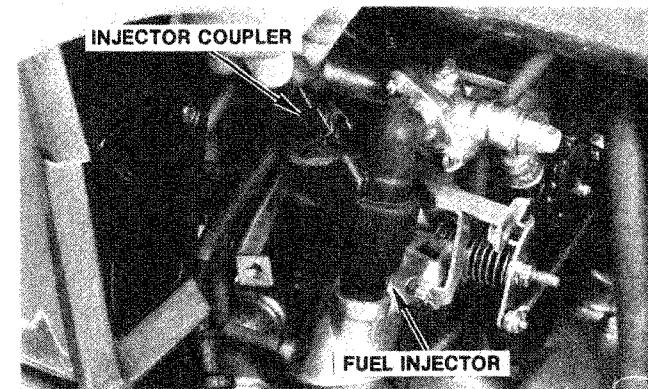

LED Inspection

The LED's will indicate trouble by cylinder banks. Disconnect the injector couplers one at a time and bump the starter to isolate the problem injector. (Remove the coupler retaining wire before disconnecting the coupler.)

Reconnect the couplers.

NOTE: LED's will only indicate an **open** circuit if both injectors of either bank are affected simultaneously. Be sure to check the injector lines or injector for a **short** circuit.

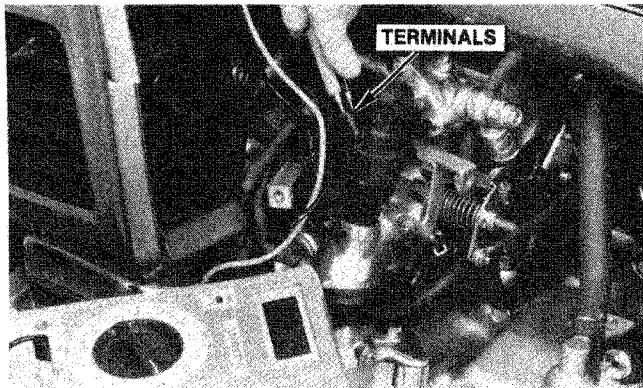

Injector Coil Inspection

With the engine stopped and the ignition switch ON check the wiring for continuity by observing the LED's.

NOTE: Be sure couplers are connected securely.

Turn the ignition switch OFF. Disconnect the injector coupler and measure the resistance between the terminals.

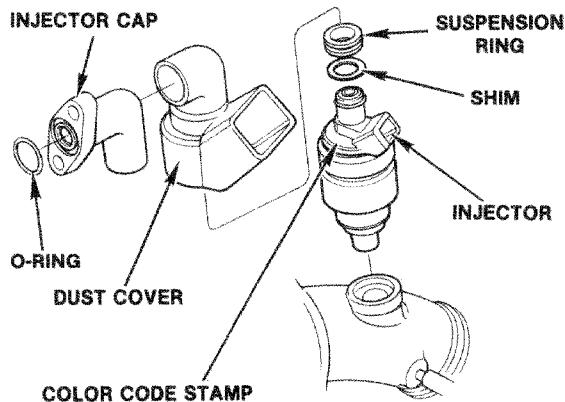

Standard: 1.55-1.85 ohms (20° C, 68° F)

Removal/Installation

Disconnect the injector coupler. Remove the injector cap, dust cover, suspension ring and shim. Keep all removed parts in their original sets.

Install parts in the reverse order of removal. Apply a thin coat of clean engine oil to the injector O-ring, and the intake pipe mating face. Use only dowel bolts to install the injector cap.

Shim Selection

NOTE: Injectors must be adjusted with shims when any of the following parts are replaced:

- Fuel injector
- Fuel delivery pipe
- Fuel injector cap
- Throttle body
- Intake pipe

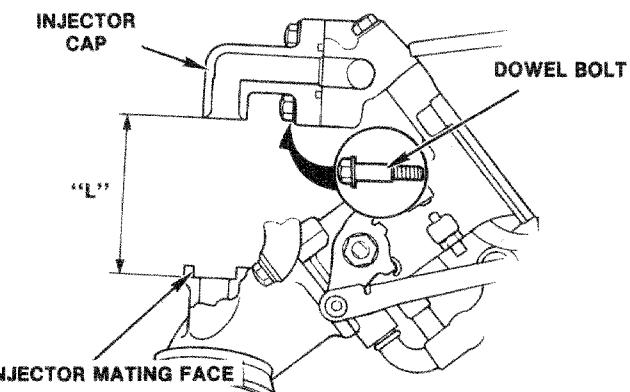

Shim only the affected injector.

Determine the injector color code.

Measure the distance "L" between the cap end and intake pipe injector mating face.

Select a shim from the table based on the "L" distance and color code.

		SHIM SELECTION TABLE			
		Unit: mm(in)			
Injector Color Code	Distance "L"	58.5 (2.30) to 59.0 (2.32)	59.0 (2.32) to 59.5 (2.34)	59.5 (2.34) to 60.0 (2.36)	60.0 (2.36) to 60.5 (2.38)
		No color code	Yellow 0.5 mm (0.02 in)	Green 1.0 mm (0.04 in)	Brown 1.6 mm (0.06 in)
Blue		Shim not used	Yellow	Green	Brown

CFI System

Pressure (PB) Sensors

LED Inspection

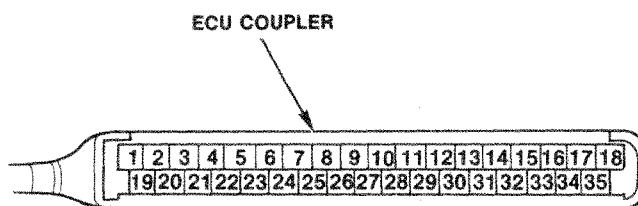

Reverse the PBR and PBL sensors' couplers. If the trouble indication shifts from the PBR to the PBL sensor, replace the PBR sensor.

Connect the inspection adapter between the PB sensor couplers and measure input voltage (see limits below).

Check for continuity between the inspection adapter white lead and the No. 9 (PBR) or No. 27 (PBL) ECU coupler terminal.

With the sensor coupler disconnected, check for no continuity between the #9/#27 terminals and body ground, and the #9/#27 terminals and any of the other ECU terminals.

Check the sensor coupler for loose or poorly contacted terminals.

Input/Output Voltage Inspection

NOTE: Further testing requires measurements which must be compensated for atmospheric pressure and temperature.

Determine atmospheric pressure (Pz) based on altitude and temperature by using the chart at the right. (If available, use a barometer.)

Compensate the voltage reading for Pz using this formula:

$$\text{Voltmeter reading} + [0.005 \times (760 - Pz)] = \text{Reading to be compared}$$

EXAMPLE

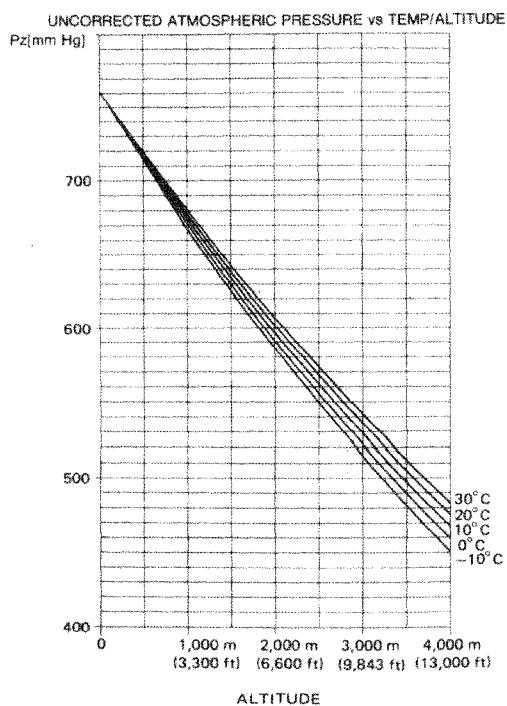

Conditions:

Altitude 1500 m (5000 ft)
Temperature 20° C (68° F)

Output voltage 2.35 V

Output Compensation:

$$2.35 + [0.005 \times (760 - 640)] = 2.95 \text{ V}$$

Remove the top compartment. Disconnect the green PBR sensor coupler and the white PBL sensor coupler.

Connect the inspection adapter between the PB sensor couplers.

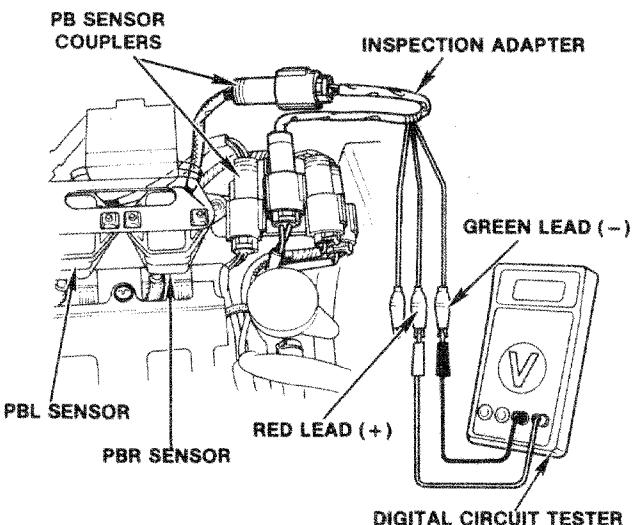

Turn the ignition switch ON and measure the input voltage between the red and green adapter leads.

Input voltage (under atmospheric pressure): 4.75-5.25 V

If there is no voltage, inspect the wiring harness for an open circuit.

Check for continuity between the No. 29 ECU terminal and the adapter red lead.

If the above test results indicate no problem, measure input voltage between the #1 and #2 terminals of the ECU coupler. If all voltage readings are correct, install a new ECU.

Disconnect the vacuum tube from the PB sensor. Turn the ignition switch ON. Measure the output voltage between the white (+) and green (-) inspection adapter leads.

Output voltage (under atmospheric pressure): 3.58-4.02 V

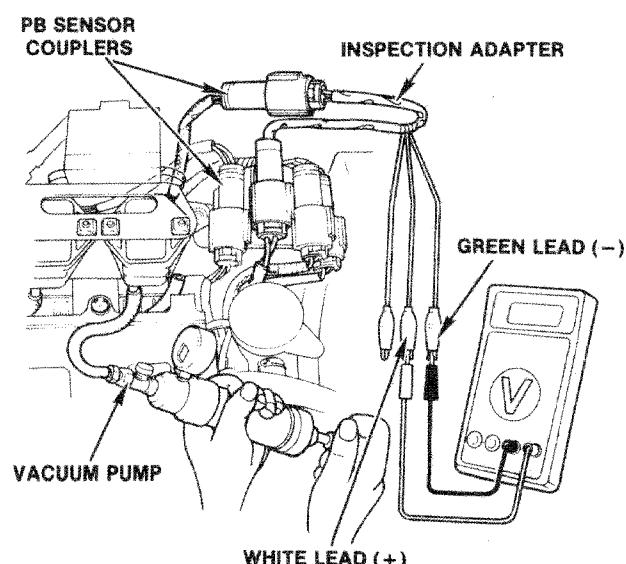

Connect a hand vacuum pump to the PB sensor and apply vacuum.

Turn the ignition switch ON. While maintaining the vacuum, measure the output voltage between the white and green adapter leads.

The PB sensor is OK if the voltage readings fall within the limits shown below.

TEST VACUUM				OUTPUT VOLTAGE
mm Hg	kPa	kg/cm ²	psi	
100	13.73	0.14	1.93	2.85-3.50V
300	40.21	0.41	5.83	2.16-2.45V
500	66.69	0.68	9.67	1.21-1.40V

(cont'd)

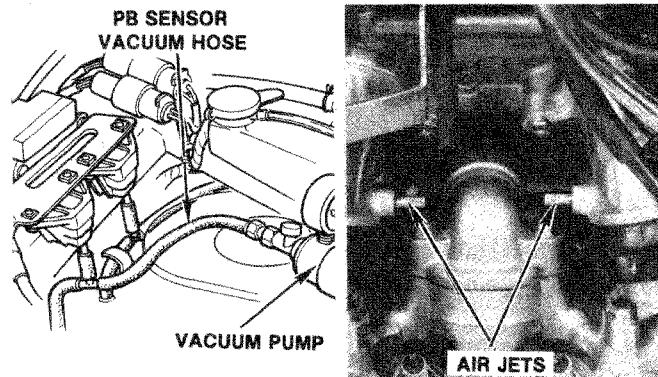

CFI System

Pressure (PB) Sensors (cont'd)

Vacuum Hose Inspection

Remove the plug from the dead end hose and connect a hand vacuum pump between the PB sensor and vacuum hose as shown.

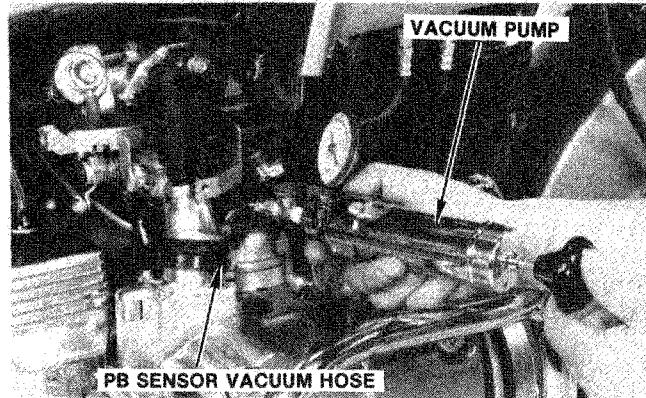

Start the engine. If the pointer of the tester does not swing, check for a blocked or collapsed vacuum hose, or clogged intake pipe air jet.

Connect the vacuum hose to the PB sensor and disconnect the vacuum hose from the 3-way joint.

Connect a vacuum tester to the vacuum hose and apply vacuum.

If vacuum decreases faster than 20 mm (7.8 in) Hg per minute, check the vacuum hose for deterioration.

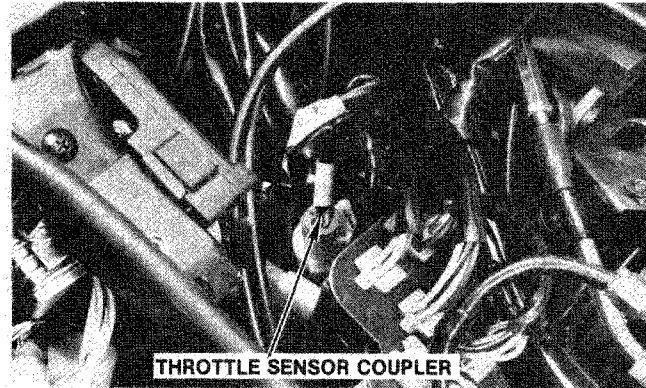

Throttle (0th) Sensor

LED Inspection

Connect the inspection adapter between the ECU and throttle sensor couplers and measure the input voltage (see page 10-13).

Check for continuity between the white adapter lead and the #11 ECU coupler terminal.

With the sensor coupler disconnected, check for no continuity between the #11 ECU coupler terminal and the body ground.

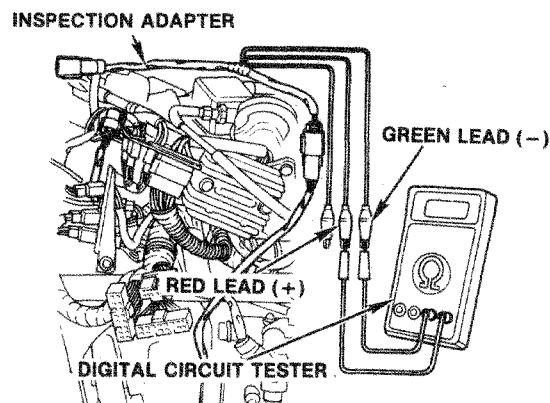

Sensor Resistance Inspection

Check the sensor coupler for loose or poorly contacted terminals.

Turn the ignition switch OFF. Disconnect the wire harness coupler from the adapter. Measure the resistance between the red and green adapter leads connected to the coupler's sensor side.

Sensor resistance: 4-6 K ohms

Install a new sensor if the resistance is outside specifications.

Input/Output Voltage Inspection

Disconnect the throttle sensor coupler from the coupler holder. Connect the inspection adapter between the sensor couplers.

With the ignition switch ON, measure the input voltage between the red (+) and green (-) adapter leads.

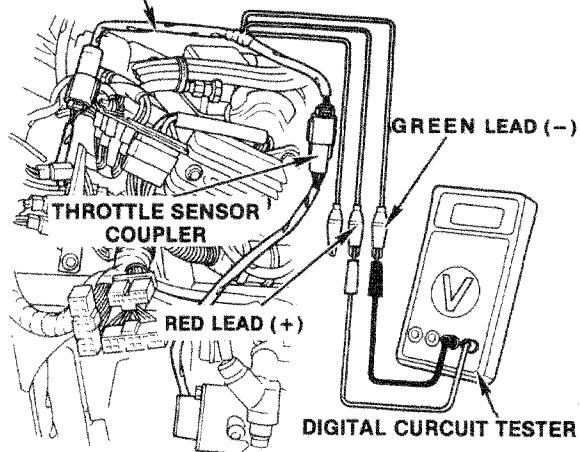

Input voltage: 4.75- 5.25 V

If the voltage is incorrect, check the wiring harness and ECU.

If input voltage is not present, check for continuity between the red adapter lead and the No. 29 ECU coupler terminal.

If there is continuity, measure the voltage between the No. 1-2 ECU coupler terminals. If the voltage is OK, install a new ECU.

INSPECTION ADAPTER

With the ignition switch ON, measure the output voltage between the white (+) and green (-) adapter leads while gradually opening the throttle.

Replace the sensor if the voltage does not rise smoothly as the throttle is opened.

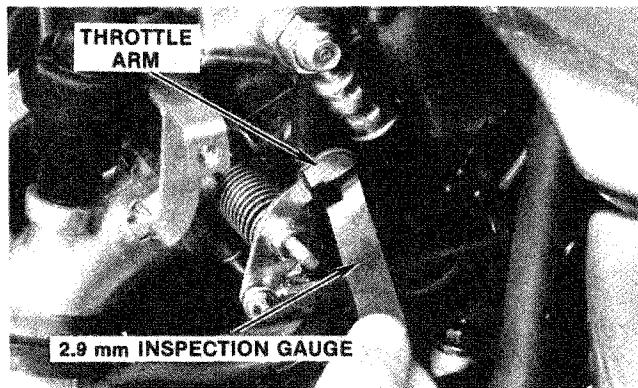

Loosen the idle adjustment screw and insert a 2.9 mm (0.11 in) inspection gauge between the throttle arm and throttle stop screw.

Set the tester in the 2V range and measure the voltage with the inspection gauge left in place.

Output voltage: 0.475- 0.495 V

NOTES:

- Do not loosen the stop screw lock nut.
- Use only a 2.9 mm (0.11 in) inspection gauge.

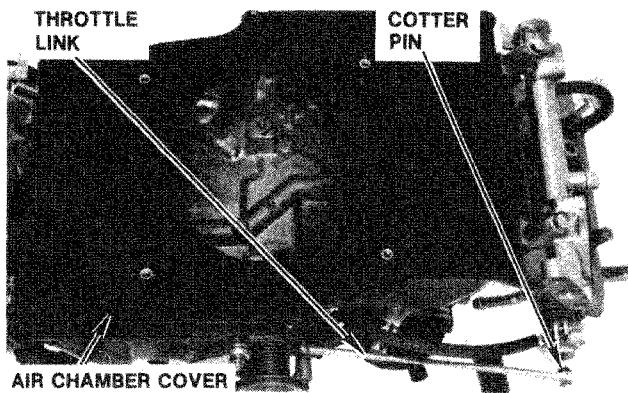

(cont'd)

CFI System

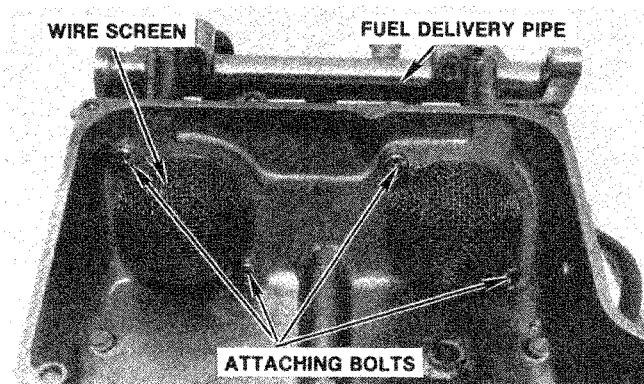

Throttle (0th) Sensor (cont'd)

Removal/Installation

Remove the air chamber cover. Remove the cotter pin and washer. Disconnect the throttle link from the throttle arm.

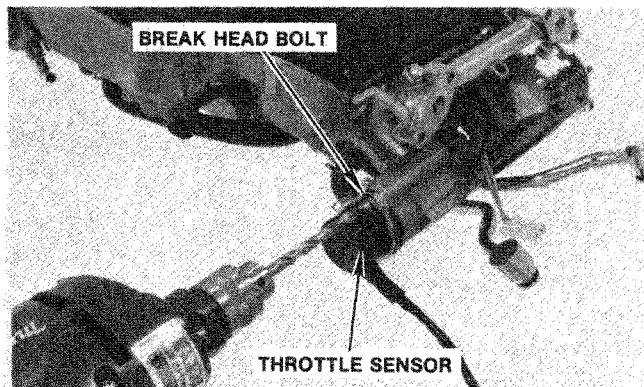

Unscrew the three bolts and remove the fuel delivery pipes. Unbolt and remove the throttle body and wire screen.

Center punch the break head bolt. Break the head off the bolt by drilling a 9 mm (0.35 in) hole through the marked location.

Install a new sensor on the throttle body using new break head bolts.

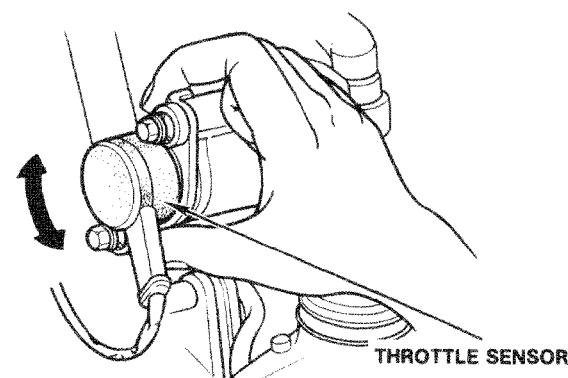

NOTE: Do not break the heads off the bolts until after adjusting the sensor.

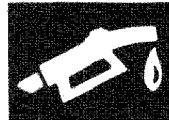

Install the throttle body on the engine. Insert the 2.9 mm gauge between the throttle valve arm and stop screw.

Turn the sensor until the output voltage is 0.475-0.495.

Start the engine and recheck the voltage. If the voltage is OK, turn the bolts further to break off the heads.

Crankshaft Angle (Ns) Sensor

LED Inspection

Measure sensor coil resistance between the No. 6 and No. 25 ECU coupler terminals. Resistance should be 297- 363 ohms at 20° C (68° F). If resistance is incorrect, check the sensor (see below).

Check for continuity between the sensor coupler harness side terminal and the ECU coupler. The sensor is normal if there is continuity between the No. 6 ECU terminal and the sensor harness Y terminal; the No. 25 ECU terminal and the sensor harness W terminal.

With the sensor disconnected, check for continuity between the No. 6 and No. 25 ECU terminal and ground or other terminals.

Check the sensor coupler for poor contact at the terminals.

Coil Resistance Inspection

Remove the ignition coil from the frame (see page 7-5). Remove the Ns sensor white 2P coupler from the holder. Measure the resistance between the yellow and white coupler terminals.

Resistance: 297-363 ohms

Check for no continuity between each of the two terminals and body ground. Install a new Ns sensor if the resistance is out of specification.

Air Gap Inspection

NOTE: Inspect the air gap when the sensor is replaced or the timing belt drive pulley is removed.

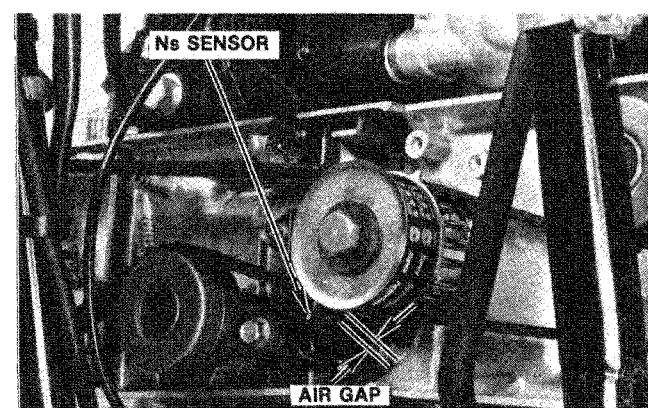

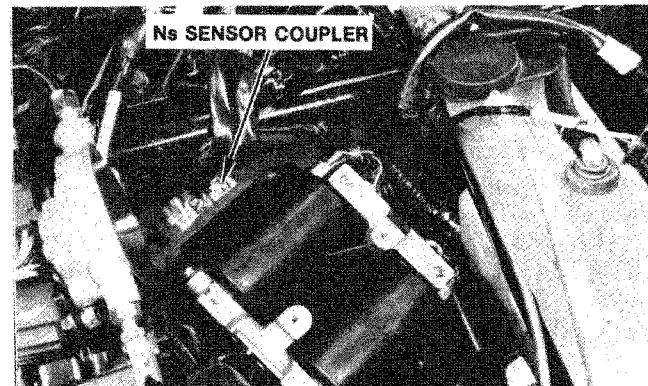

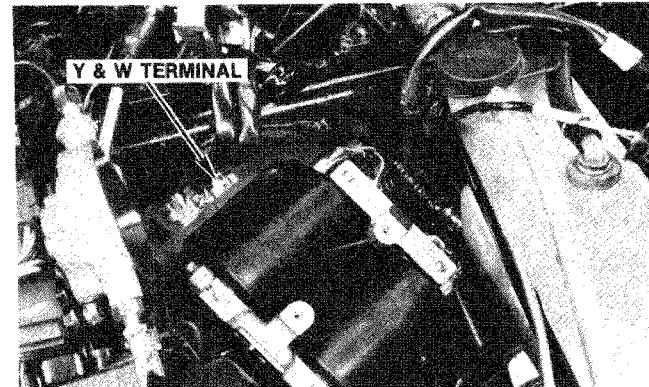

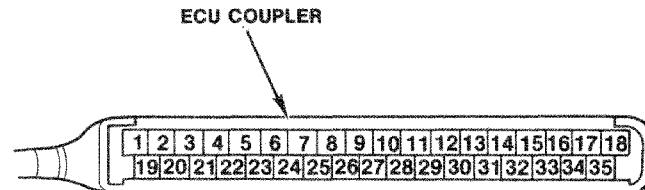

Remove the radiator.

Remove the right and left front timing belt covers.

Rotate the crankshaft and align the rotor projection with the sensor.

Measure the air gap.

Air gap: 0.4-0.9 mm (0.016-0.035 in)

CFI System

Camshaft Angle (GR, GL) Sensors

LED Inspection

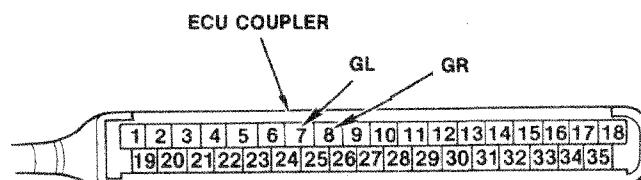

If the GR sensor is faulty, measure the resistance between the No. 8 and No. 24 ECU coupler terminals. If the GL sensor is faulty, measure the resistance between the No. 7 and No. 24 ECU coupler terminals. Resistance should be 140-180 ohms at 20° C (68° F).

Disconnect the sensor coupler and measure the resistance of the sensor coil (see below).

Check for continuity between the harness side sensor coupler terminals and the ECU terminals. The sensor is normal if there is continuity between the Y/W sensor terminal and the No. 7 ECU terminal; the Bu/W terminal and the No. 8 terminal, and each of the yellow and blue terminals and the No. 24 terminal.

With the sensor coupler disconnected, check for no continuity between the No. 7 and No. 8 ECU coupler terminals and ground or other terminals.

Check the sensor coupler for poor contact at the terminals.

Coil Resistance Inspection

Remove the fairing.

Remove the GR/GL white 4P sensor coupler from the holder. Measure the GL sensor coil resistance between the W with Y tube and Y terminal. Measure the NR sensor coil resistance between the G with Bu and W tubes and Bu terminal.

Resistance: 140-180 ohms (at 20° C, 68° F)

Check for no continuity between each terminal and body ground. Install a new sensor if there is continuity.

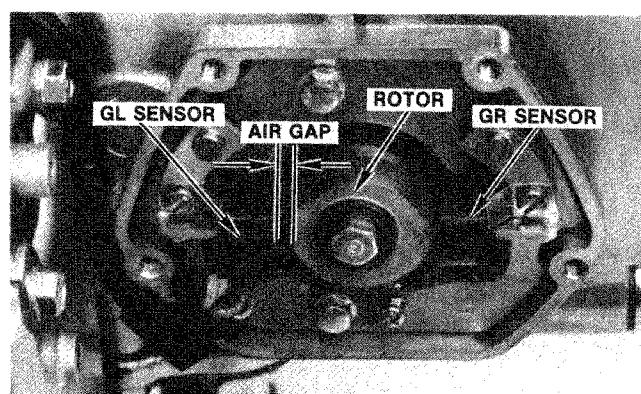

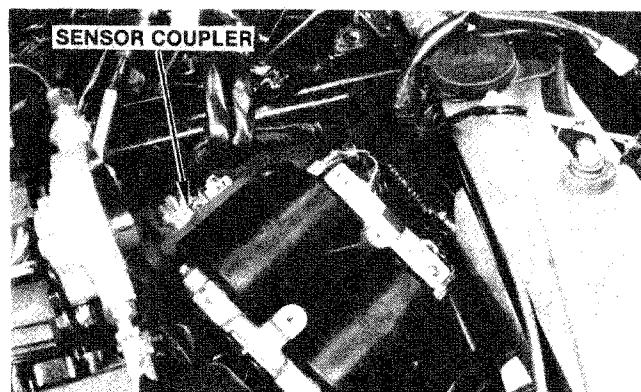

Air Gap Inspection

NOTE: Check the air gap when the sensor is removed or replaced.

Remove the sensor cover. Rotate the crankshaft and align the rotor projection with the sensor.

Measure the air gaps.

Air gap: 0.58-0.62 mm (0.023-0.024 in)

Removal/Installation

Remove the ignition coil from the frame (see page 7-3).

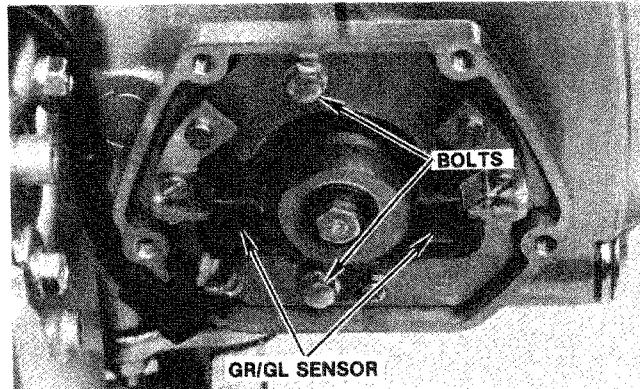

Remove the white 4P sensor couplers from the GR/GL coupler holder.

Remove the sensor cover. Remove the two bolts and remove the sensors.

NOTE: The GR and GL sensors should be handled as a matched set. Install them in pairs.

Install the sensors in the reverse order of removal.

NOTE: Inspect the air gap when the sensors or rotors are replaced (see page 10-28).

Air Temperature (T1) Sensor

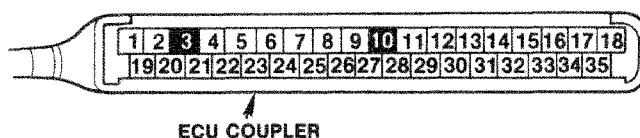

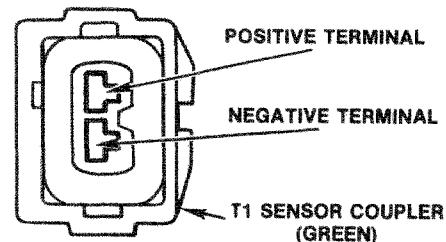

LED Inspection

Disconnect the coupler from the sensor and measure voltage between the terminals. Voltage should be 4.75-5.25 V with the ignition switch ON.

If there is no voltage, check the wiring harness for an open circuit. Check for continuity between the sensor negative (-) terminal and the No. 3 ECU terminal; between the positive (+) terminal and the No. 10 ECU terminal.

With the sensor coupler disconnected, check for no continuity between the No. 10 ECU terminal and each of the other terminals and ground. If there is continuity, check the wiring harness for a short circuit.

Check the sensor coupler for poor contact at the terminals. If the coupler is OK, check the sensor.

(cont'd)

CFI System

Air Temperature (T1) Sensor (cont'd)

Sensor Inspection

Suspend the sensor in cold water. Heat the water slowly. Measure resistance between the terminals.

Resistance:

2-3 K ohms at 20° C (68° F)
0.2-0.4 K ohms at 80° C (176° F)

NOTE: If the unit or thermometer touches the pan, false readings will result.

If resistance is outside the above ranges, replace the T1 sensor.

Removal/Installation

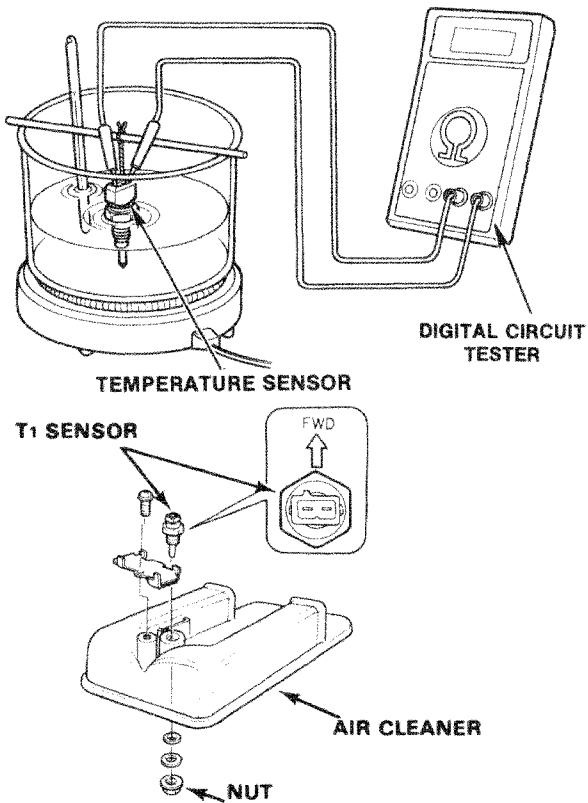

Open the top compartment.

Remove the fuse/relay box from the holder.

Disconnect the coupler from the sensor.

Remove the sensor from the air cleaner cover by removing the nut.

Install the sensor and fuse/relay box in the reverse order of removal.

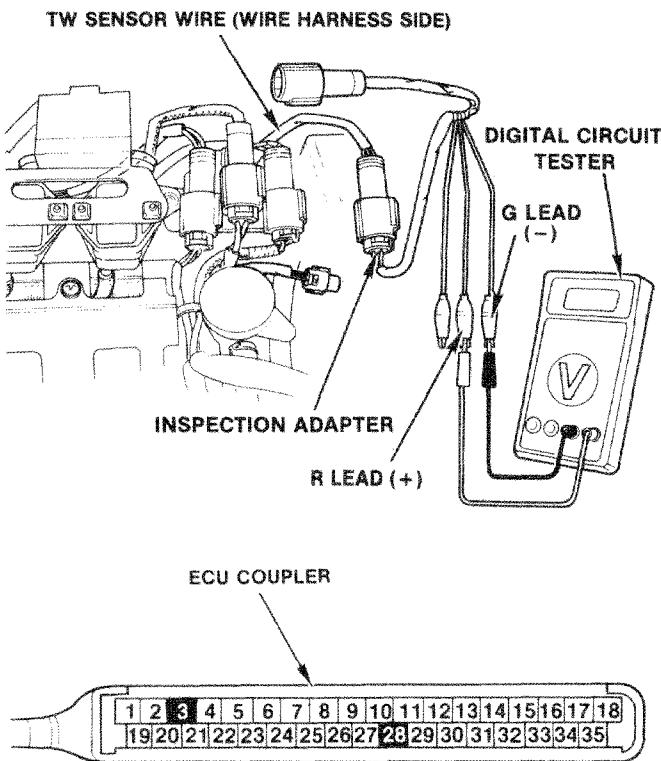

Coolant Temperature (TW) Sensor

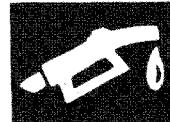

Disconnect the sensor (waterproof 2P blue) coupler. Connect the inspection adapter to the harness side coupler. Turn the ignition ON. There should be 4.75-5.25 V across the red (+) and green (-) adapter leads.

If there is no voltage, check the wiring harness. Check for no continuity between the red lead and the No. 28 ECU terminal, and between the green lead and the No. 3 terminal. Continuity indicates an open circuit.

With the sensor coupler disconnected, check for no continuity between the No. 28 ECU terminal and each of the other terminals and body ground. Continuity indicates a short circuit.

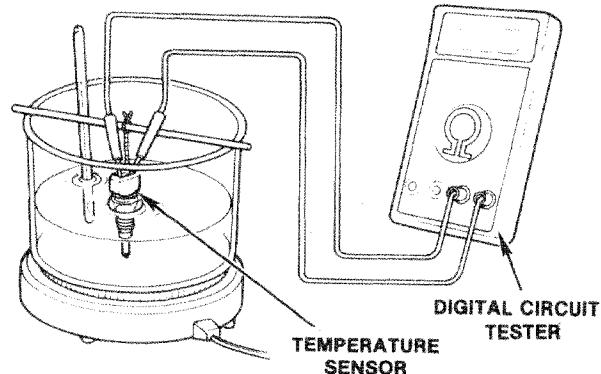

If the above test results indicate no problem, measure resistance between the terminals on the sensor side. Resistance should range between 1 and 3 K ohms with the engine cold. If resistance indicates no continuity, check the sensor sub-harness for an open or short circuit, and the sensor coupler for poor contact at the terminals.

Sensor Inspection

Inspect the sensor following the same steps used to test the T1 sensor (see page 10-18).

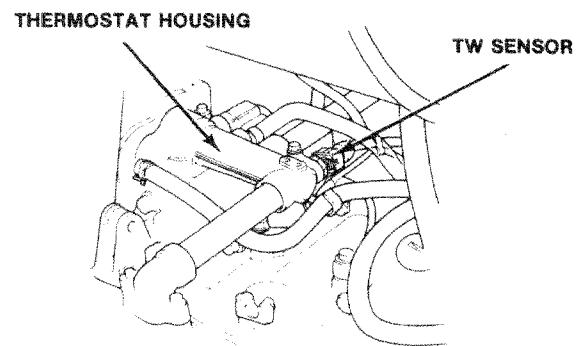

Removal/Installation

Remove the throttle body/air chamber assembly (see page 10-34). Remove the sensor from the thermostat housing, and plug the hole with a cap.

Install the sensor in the reverse order of removal.

NOTES:

- Coat the sensor threads with a sealing agent before installation.
- After installation, check for leaks and check the coolant level.

Fuel Pump

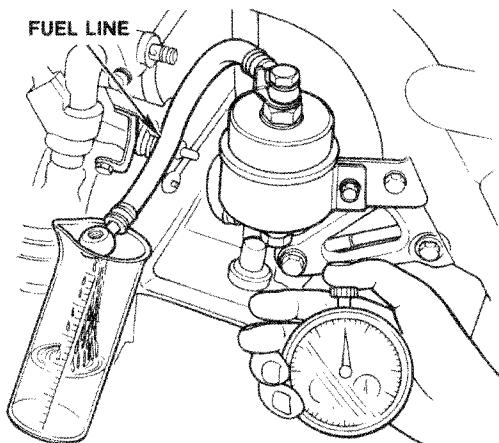

Operation Inspection

Turn the ignition OFF. Disconnect the fuel line from the left fuel delivery pipe by removing the joint nut.

Engage the transmission with the clutch lever out, and push the starter button so the starter motor will not work but the fuel pump operates.

Measure the amount of fuel discharged.

Fuel pump capacity: 630 cc (21.3 oz)/minute minimum

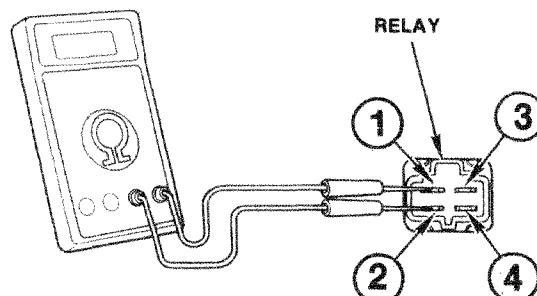

Main/Fuel Pump Relay Inspection

Remove the relay from the fuse/relay box.

Check for no continuity between terminals (1) and (2). If there is continuity, install a new relay.

Apply battery voltage across terminals (3) and (4) and check for continuity between terminals (1) and (2). If there is no continuity, install a new relay.

(cont'd)

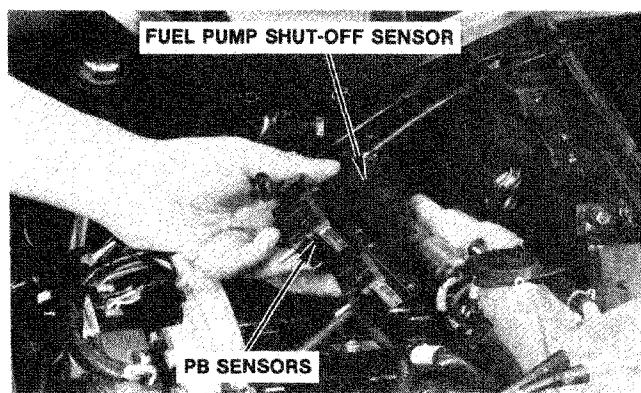

CFI System

Fuel Pump (cont'd)

Shut-Off Sensor Inspection

Disconnect the vacuum hoses from the PB sensors. Leaving the couplers connected, detach the fuel pump shut-off sensor and PB sensors as a unit.

Turn the ignition ON and tilt the sensor to the left and right. The main and fuel pump relays in the fuse/relay box should operate as the sensor tilts past 56-64 degrees

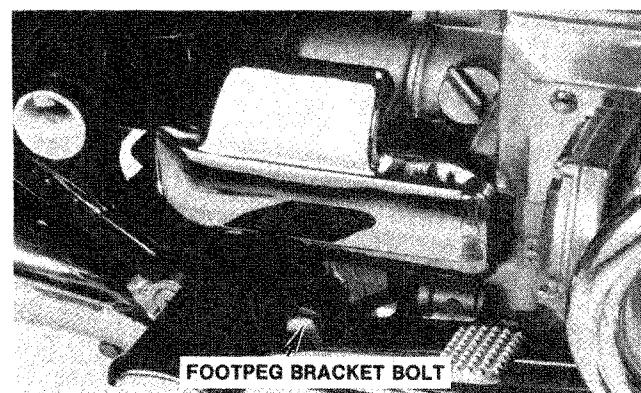

Removal/Installation

Disconnect the fuel pump white 2P coupler, located on the rear fender.

Remove the pump cover bolts and the cover.

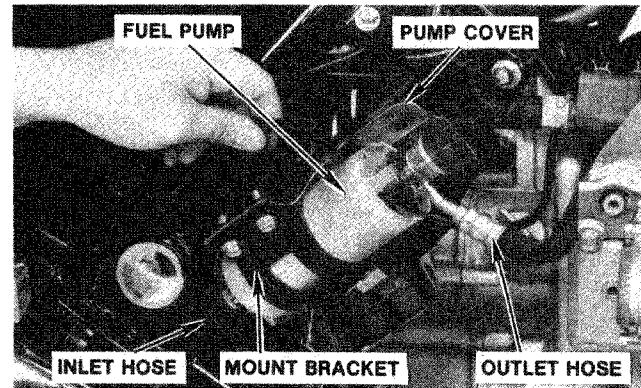

Wrap a shop towel around the fuel line and fitting. Loosen the fuel hose banjo nut slowly, then disconnect the hose.

Remove the right footpeg bracket bolt, and the fuel pump.

Disconnect the fuel lines from the pump.

Remove the mounting bracket.

Install in the reverse order of removal.

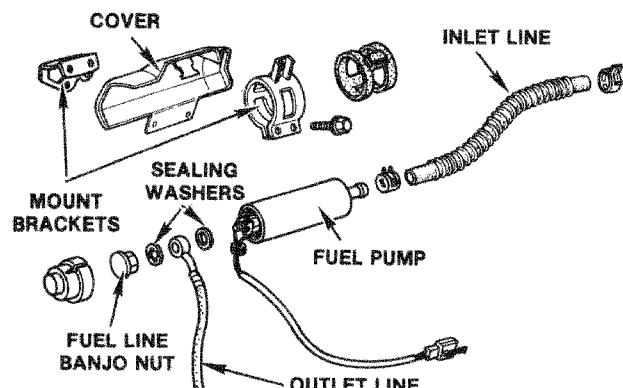

Torque values:

Fuel hose banjo nut: 28 N.m (20 ft-lb)

Footpeg bracket bolt: 60 N.m (43 ft-lb)

NOTES:

- Use new sealing washers on the banjo fittings.
- Keep the fuel lines away from sharp edges and corners.
- Check for leaks after installation.

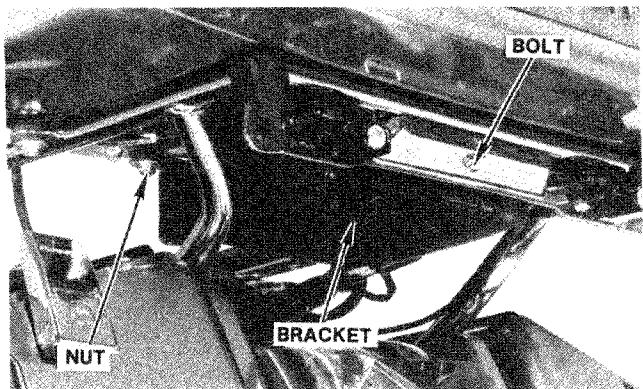

CFI Electronic Control Unit (ECU)

Removal

Remove the seat and the saddlebag lids. Remove the license plate light.

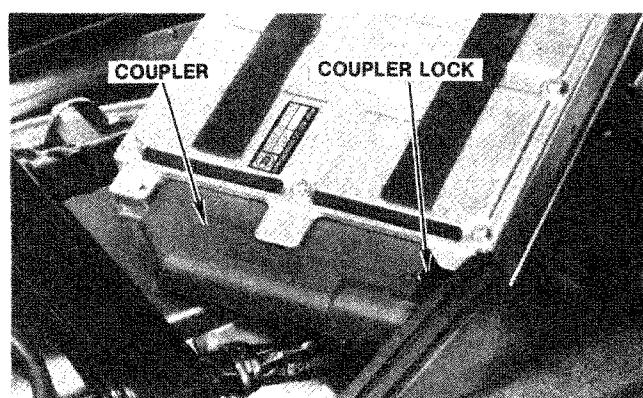

Remove the bolt and 2 ECU bracket nuts, then remove the ECU from the travel trunk bracket.

Carefully slide the ECU out of its case. Press out the ECU coupler lock, and disconnect the coupler from the ECU.

NOTES:

- Do not pry the coupler open or bend the terminals.
- Keep water, oil, and dirt away from the terminals.
- Do not attempt to disassemble the ECU.

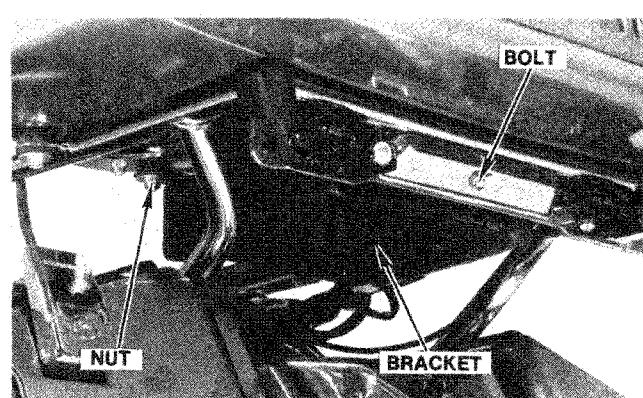

Installation

Attach the ECU coupler to the ECU hinge, and push it in until the lock engages.

Slide the ECU into its case, and install the dust cover.

CAUTION: If the dust cover is not installed, the ECU may be damaged by water or dust.

Position the ECU under the travel trunk, and install the bolt and mounting nuts.

CFI System

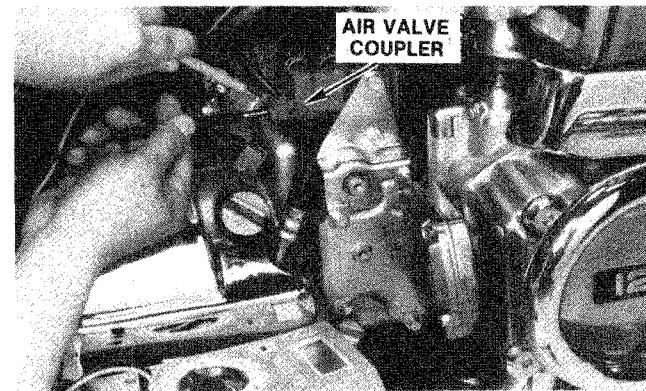

Air Valve

Inspection

Remove the air valve cover, and disconnect the coupler.

Measure the resistance between the terminals.

Resistance: 65-100 ohms

Removal/Installation

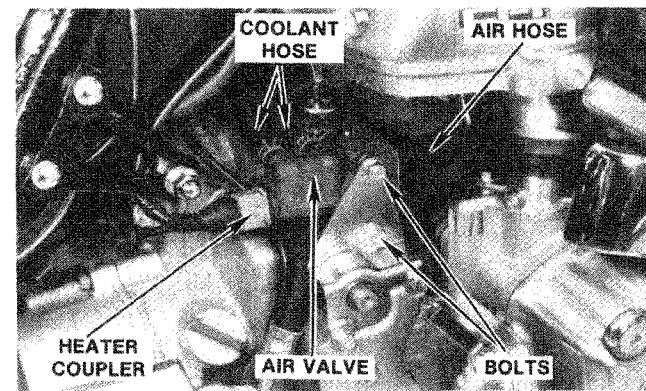

Remove the two mounting bolts and the air valve cover.

Disconnect the heater coupler from the air valve.

Disconnect the coolant and air hoses.

Remove the two air valve bolts and remove the valve.

Install in the reverse order of removal.

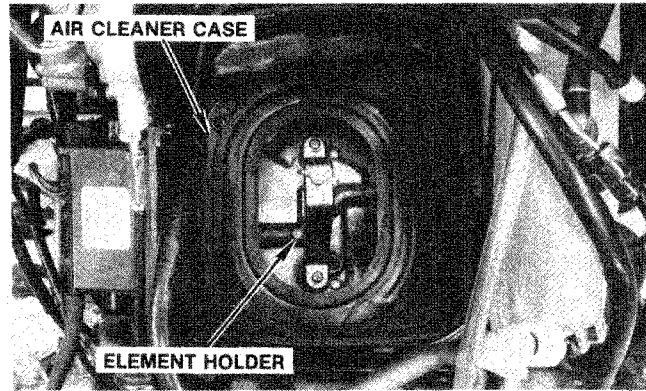

Air Chamber

Removal

NOTES:

- Keep the intake pipes, injectors, and caps in their original sets, and install them in their original locations.
- Adjust the injectors with shims whenever you install these new parts: injector, cap, delivery pipe, throttle body, and intake pipe.

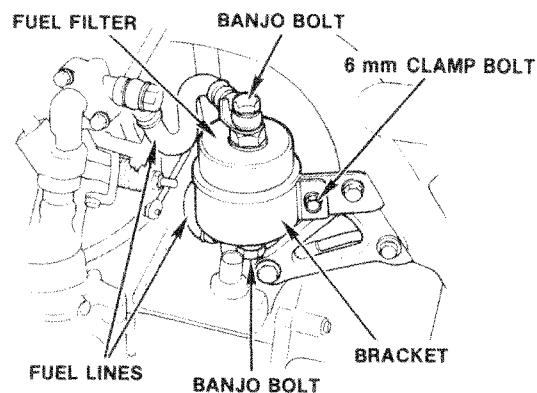

Turn the ignition OFF and disconnect the fuel pump coupler.

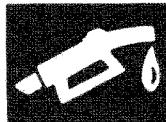

Remove the fuel filter from the left engine mount bracket.

Remove the fairing lower and inner covers (see page 9-2).

Remove the air cleaner element. Remove the four screws and the air cleaner case. Remove the element holder.

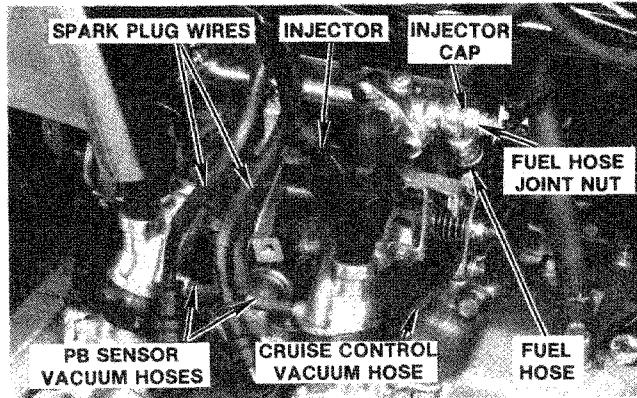

WARNING: The fuel lines are pressurized. Wear eye protection. If gasoline gets in your eyes, flush with water and get prompt medical attention.

Wrap a shop towel around the fuel line and fitting. Loosen the fuel hose banjo nut slowly, then disconnect the hose.

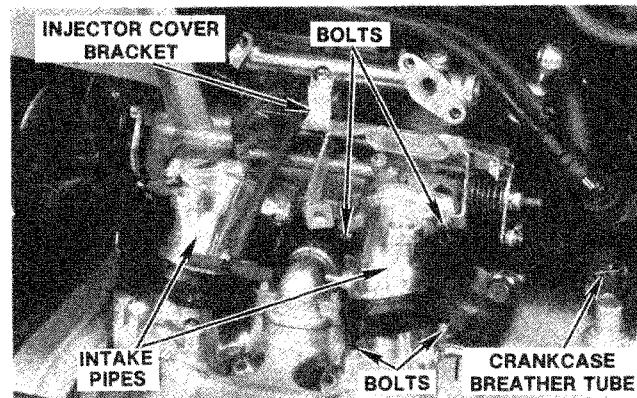

Remove the injector cap bolts and caps. Plug each injector port to keep out dirt.

Disconnect the spark plug wires. Disconnect the PB and cruise control vacuum hoses.

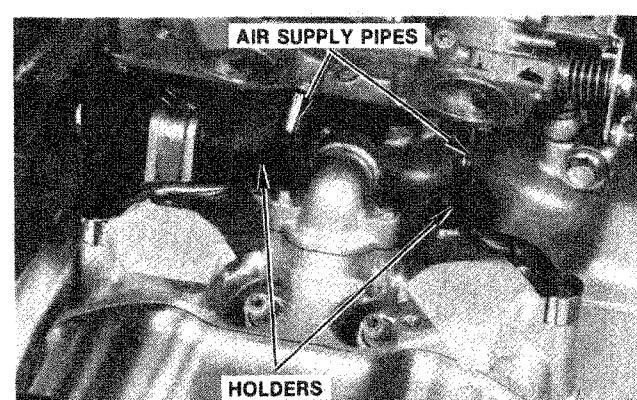

Remove the intake pipe mounting bolts, pipes, and the injector cover bracket.

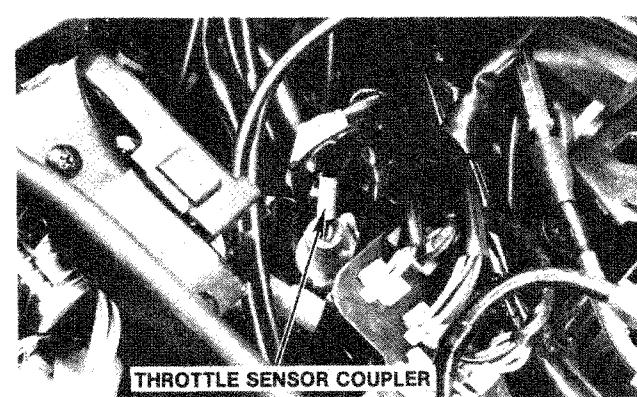

Disconnect the crankcase breather tube.

Disconnect the secondary air supply tubes from the cylinder heads and engine case holders.

Disconnect the cruise control throttle grip cancel switch and throttle sensor couplers.

(cont'd)

CFI System

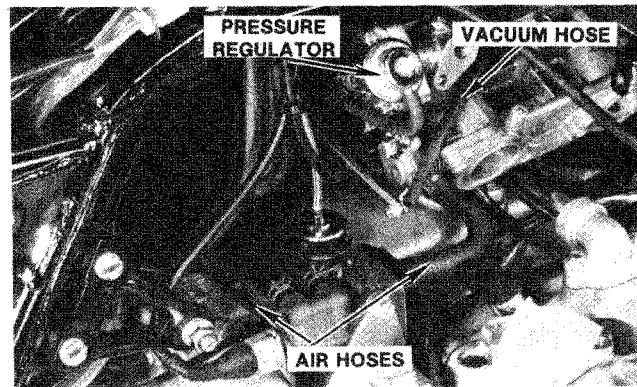

Air Chamber (cont'd)

Remove the air inlet and outlet hoses from the air valve. Disconnect the vacuum hose.

Remove the fuel pressure regulator.

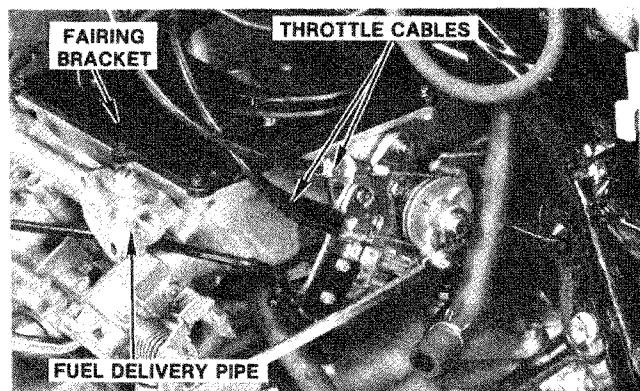

NOTE: Take care not to damage the regulator during removal.

On California models, disconnect the canister purge air hose from the purge control valve.

Pull the air chamber out to the left, and disconnect the throttle cables.

NOTE: If the left fairing bracket interferes with the air chamber, remove the left fuel delivery pipe.

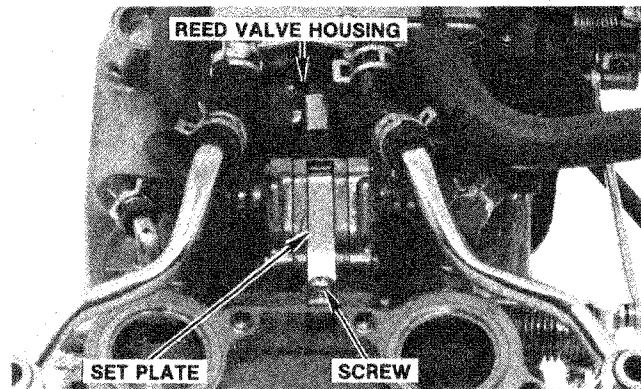

Disassembly

NOTE: See the base manual for service of the secondary air supply reed valves, and the purge control valve.

Remove the primary reed valve set plate.

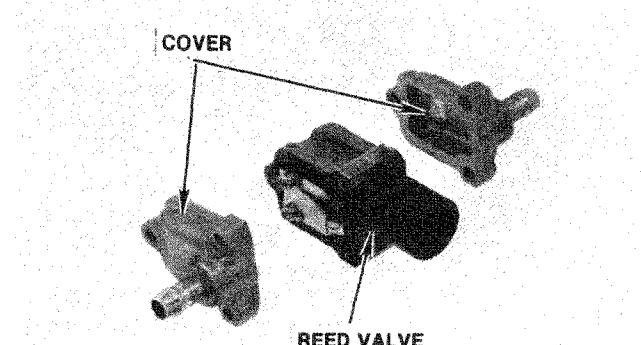

Disconnect the air hoses from the housing.

Remove the reed valve covers.

Check the reeds for signs of damage or fatigue, and replace if necessary.

Install new reeds and valves if the seat rubber is cracked or damaged, or if there is clearance between the reed and seat.

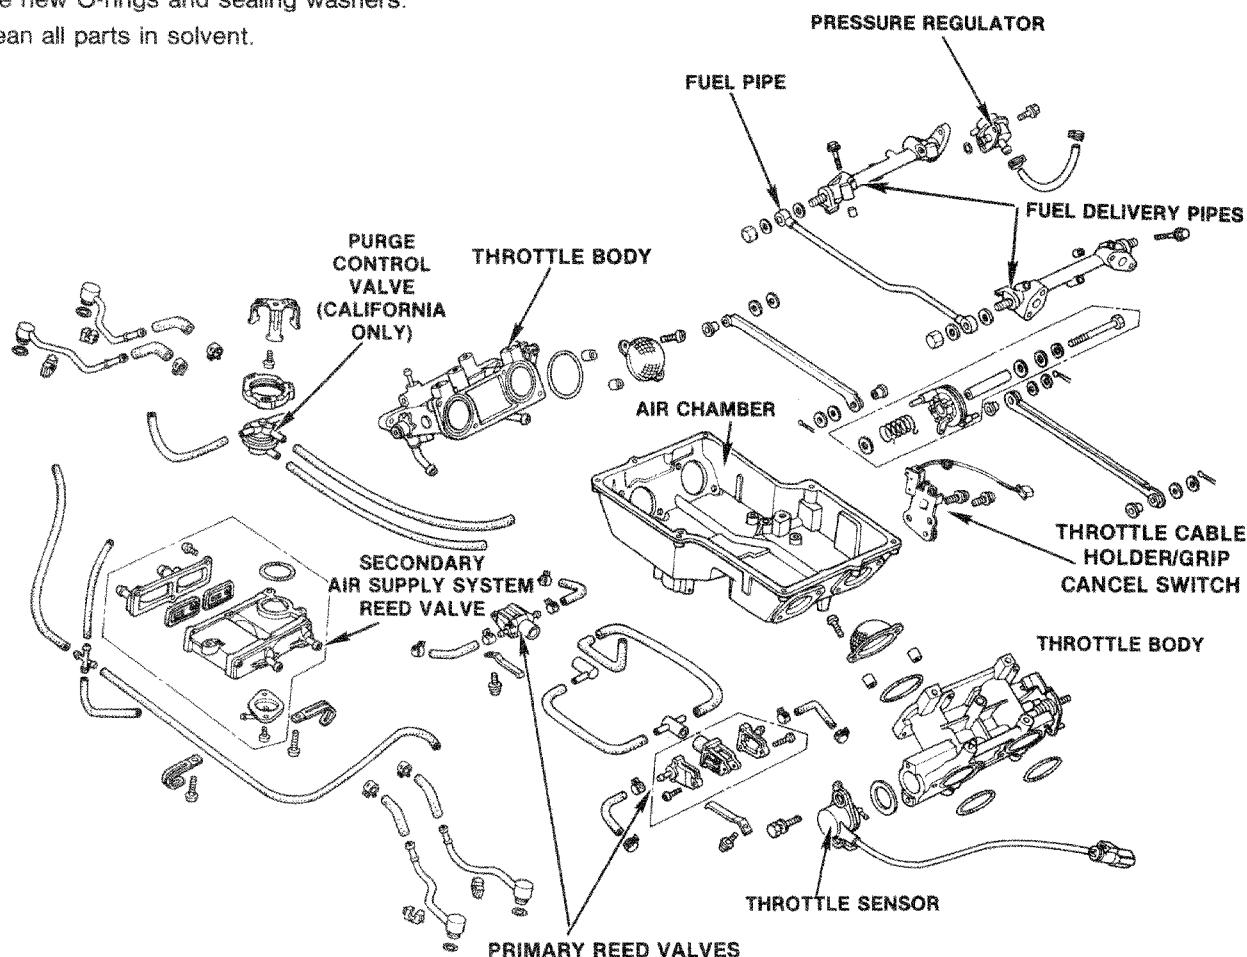

Assembly

Assemble in the reverse order of disassembly.

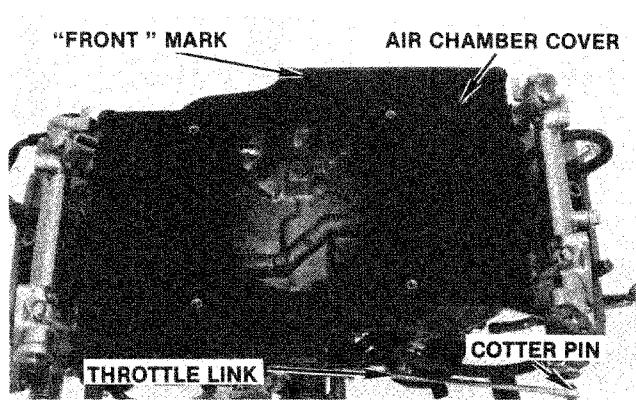

NOTES:

- Use new O-rings and sealing washers.
- Clean all parts in solvent.

Install the air chamber cover with the "front" mark facing forward.

Connect the throttle link to the throttle arm, install the washer and a new cotter pin.

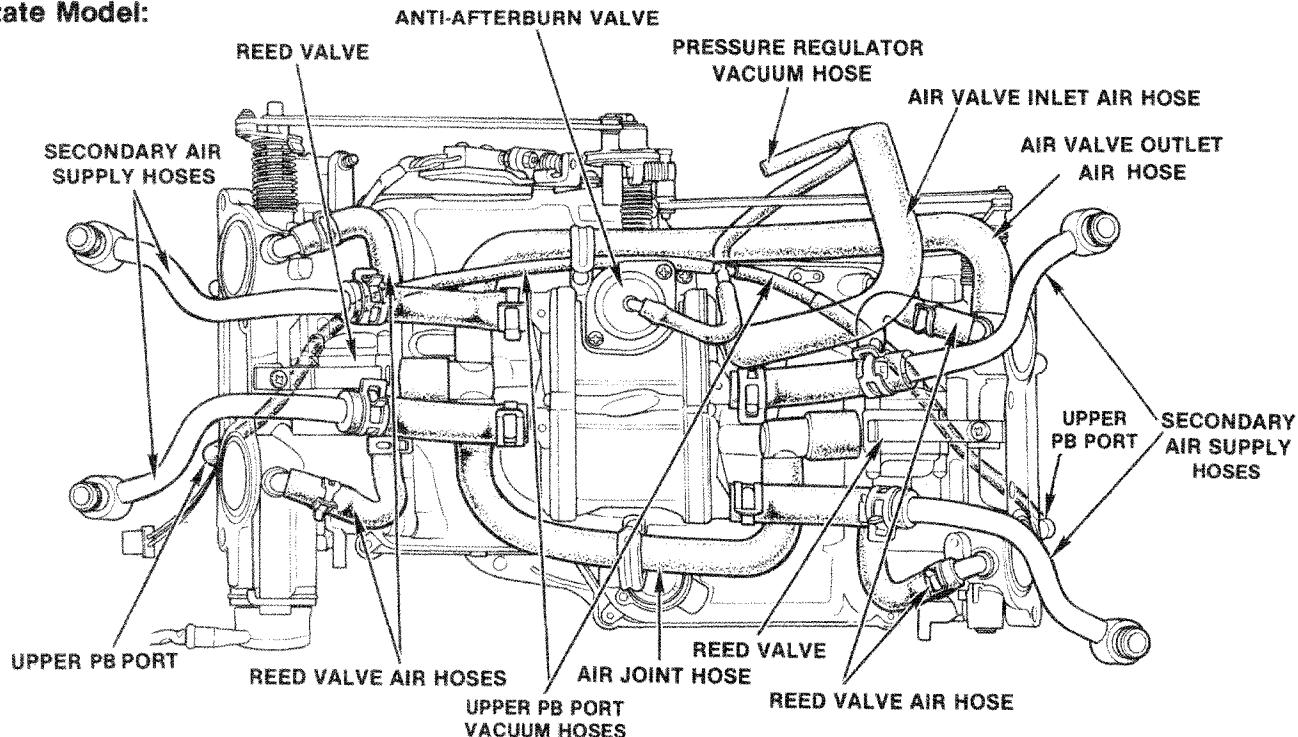

(cont'd)

CFI System

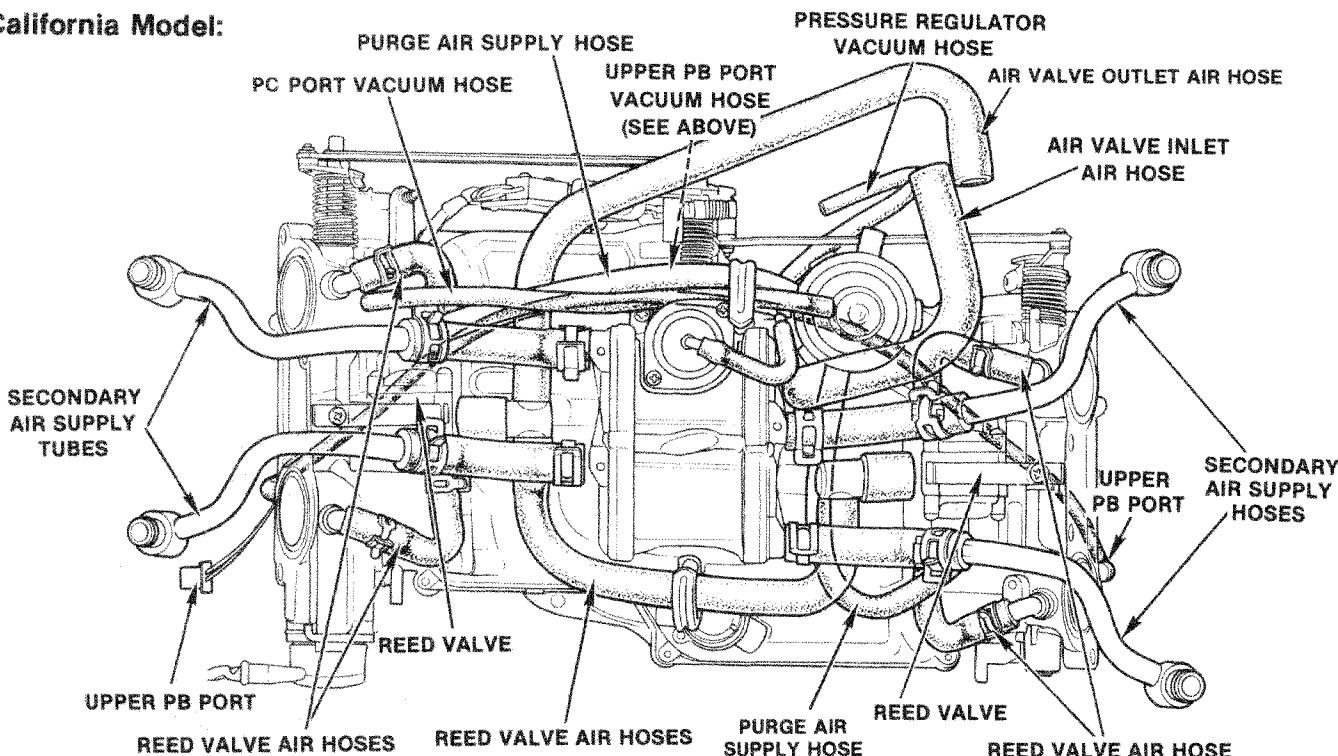

Air Chamber (cont'd)

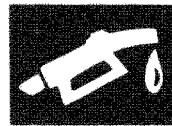

After installing the air chamber, check the vacuum hose routing diagram label.

49-State Model:

California Model:

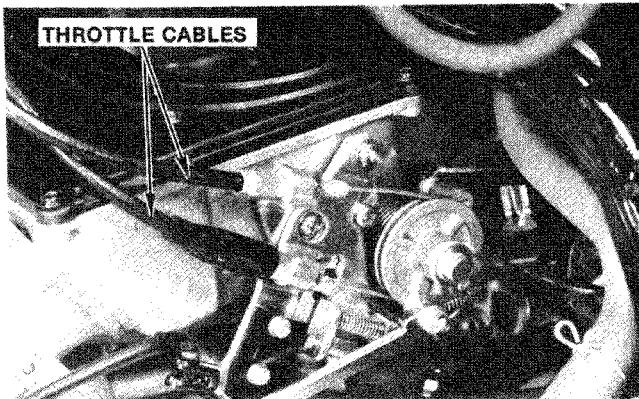

Installation

Working from the left side, push the air chamber partially into place and connect the throttle cables to the throttle drum. Check the cables for smooth operation.

NOTE: Make sure the throttle cable is connected in the junction box.

If a new throttle grip cancel switch or throttle cable holder is installed, adjust the switch (see page 28-11).

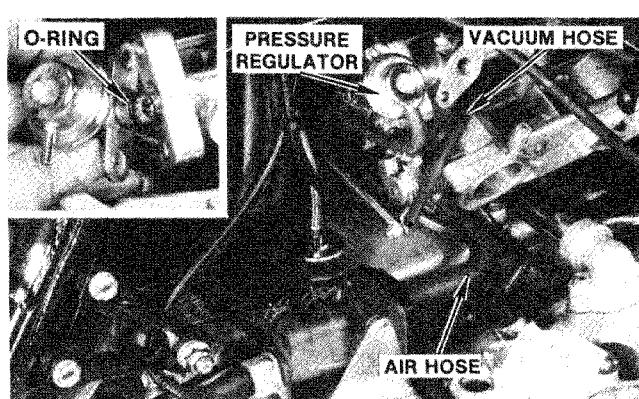

Push the air chamber into place.

NOTE: Check that the hose and pipes are not caught on surrounding parts and disconnected.

Apply a thin coat of clean engine oil to the pressure regulator O-rings, and install the right fuel delivery pipe.

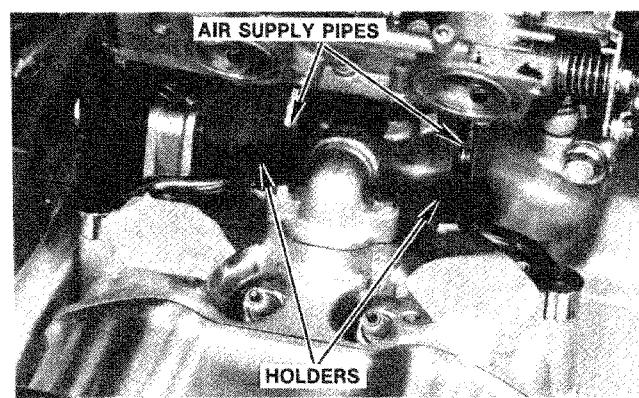

Connect the vacuum hoses to the pressure regulator.

Connect the air outlet and inlet hoses to the air chamber.

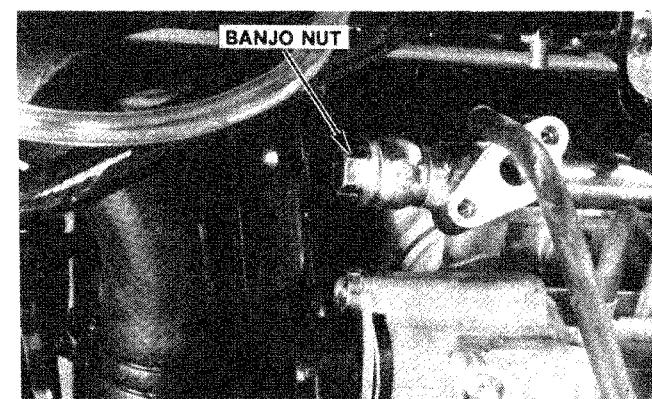

On California models, connect the purge air hose to the purge control valve.

Connect the secondary air supply hoses to the cylinder heads and to the holders on the engine case.

Connect the fuel lines to the right and left fuel delivery pipes and temporarily tighten the banjo nuts.

NOTE: Tighten the nuts after the intake pipes have been installed.

(cont'd)

CFI System

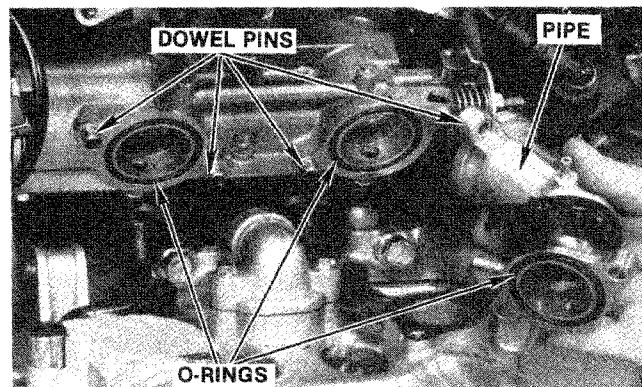

Air Chamber (cont'd) —

Installation (cont'd)

Install the O-ring and dowel pin on the throttle body.

Install the O-ring on the cylinder head end of the intake pipe.

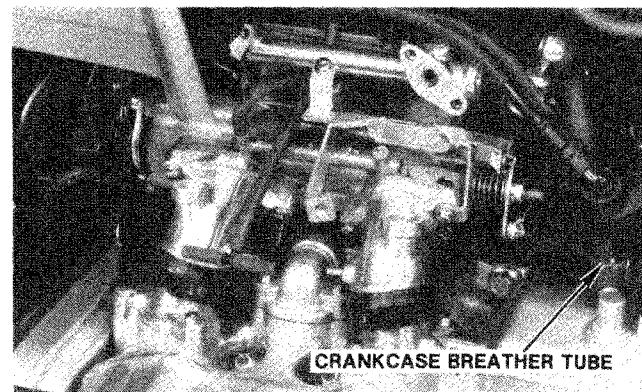

Hold the O-rings in place with grease.

Install the intake pipes between the cylinder head and throttle body.

Install the throttle body cover bracket and tighten the bolts.

Connect the crankcase breather tube to the engine.

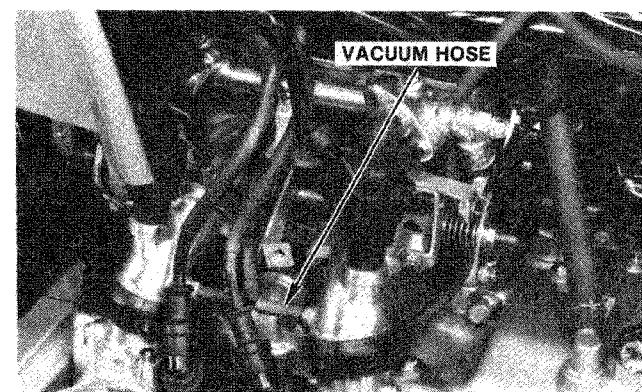

Connect the vacuum hose to the intake pipe. Connect the spark plug leads. Connect the fuel line to the left fuel delivery pipe and tighten the banjo nut.

Torque: 22 N.m (16 ft-lb)

Connect the throttle sensor and cruise control throttle grip cancel switch couplers. Install the air cleaner case and air cleaner.

Connect the fuel pump coupler, pressurize the system by turning the ignition ON, and check for leaks.

Install the fuel filter on the left engine mount bracket. Install all removed parts in the reverse order of removal.

Electronic Travel Computer

Service Information	11-2
Troubleshooting	11-4
Removal	11-12
Disassembly	11-12
Assembly	11-14

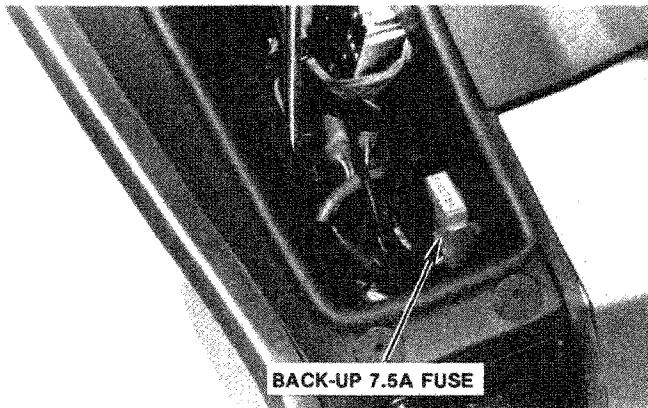

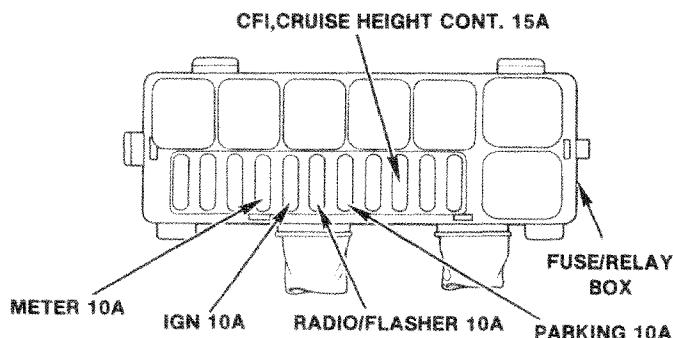

Electronic Travel Computer

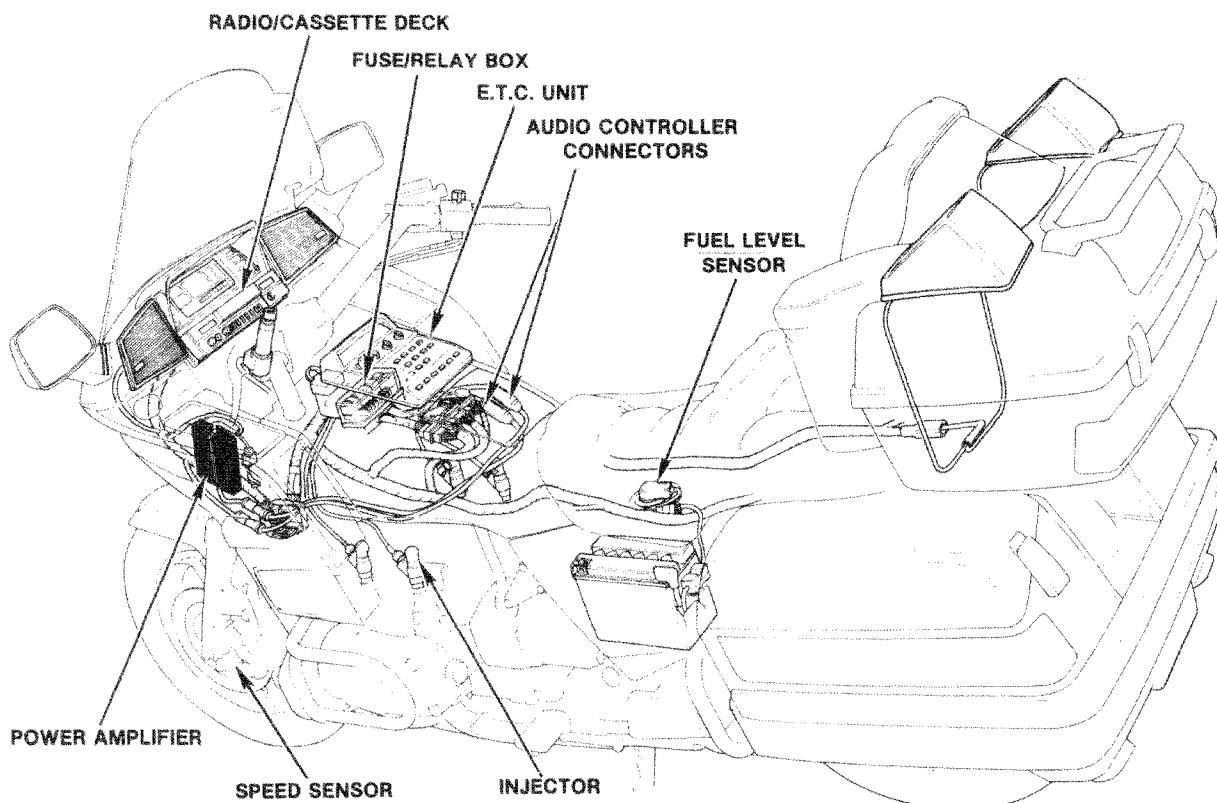

Service Information

- Measuring outputs at coupler pins: Insert the tester probes from behind the coupler pins to avoid bending or prying them open. Be careful not to short out pins.
- Testing for continuity, or measuring a voltage or resistance: Make sure all related couplers or wires are connected securely.
- Disconnecting a coupler or connector: Turn the ignition switch OFF. Positive (+) and negative (-) sides are so marked.

Fuses/Relays

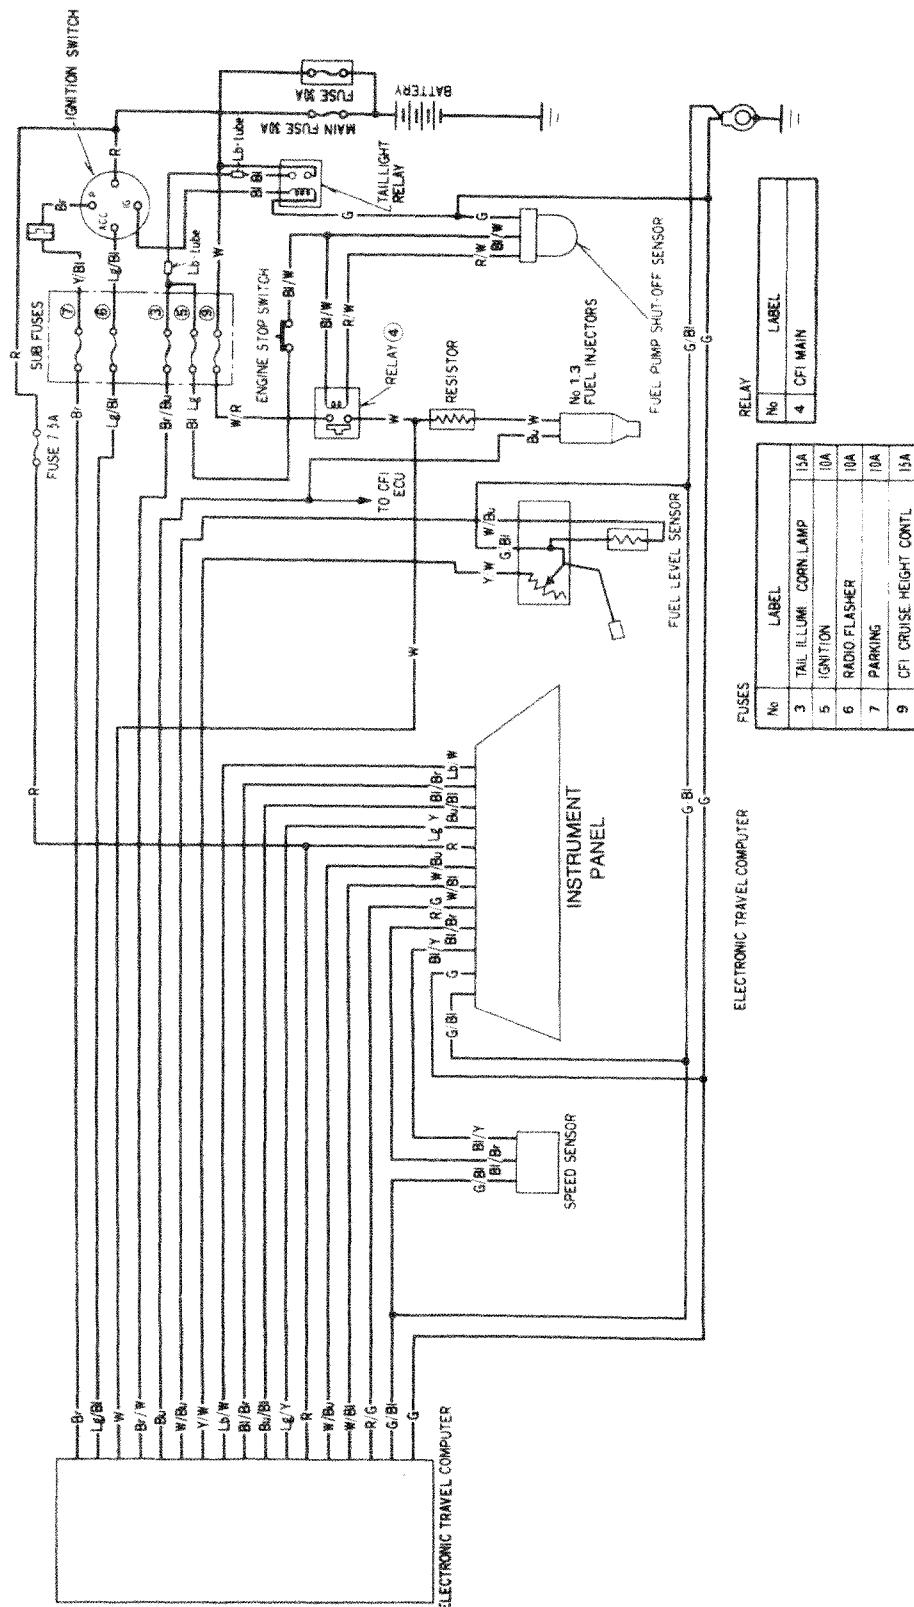

Parts Location

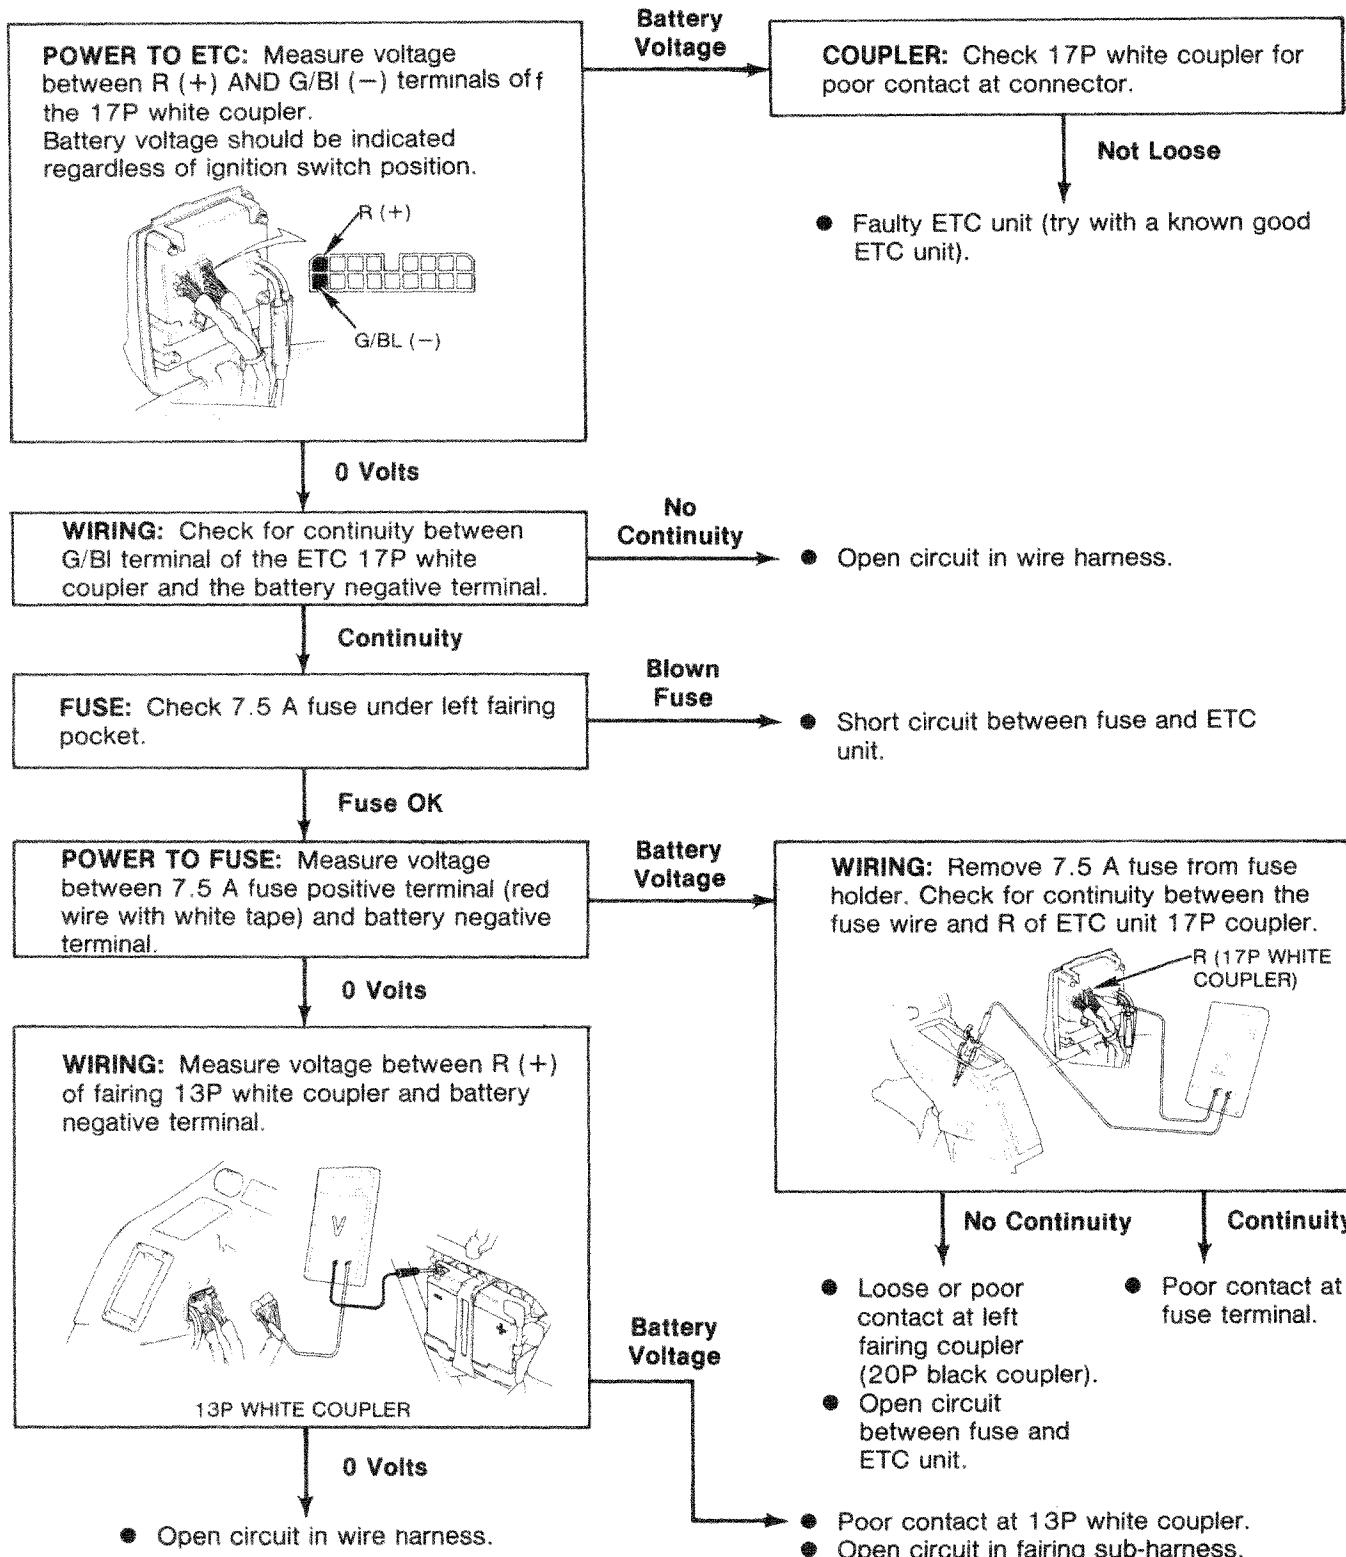

System Wiring Diagram

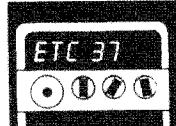

Electronic Travel Computer

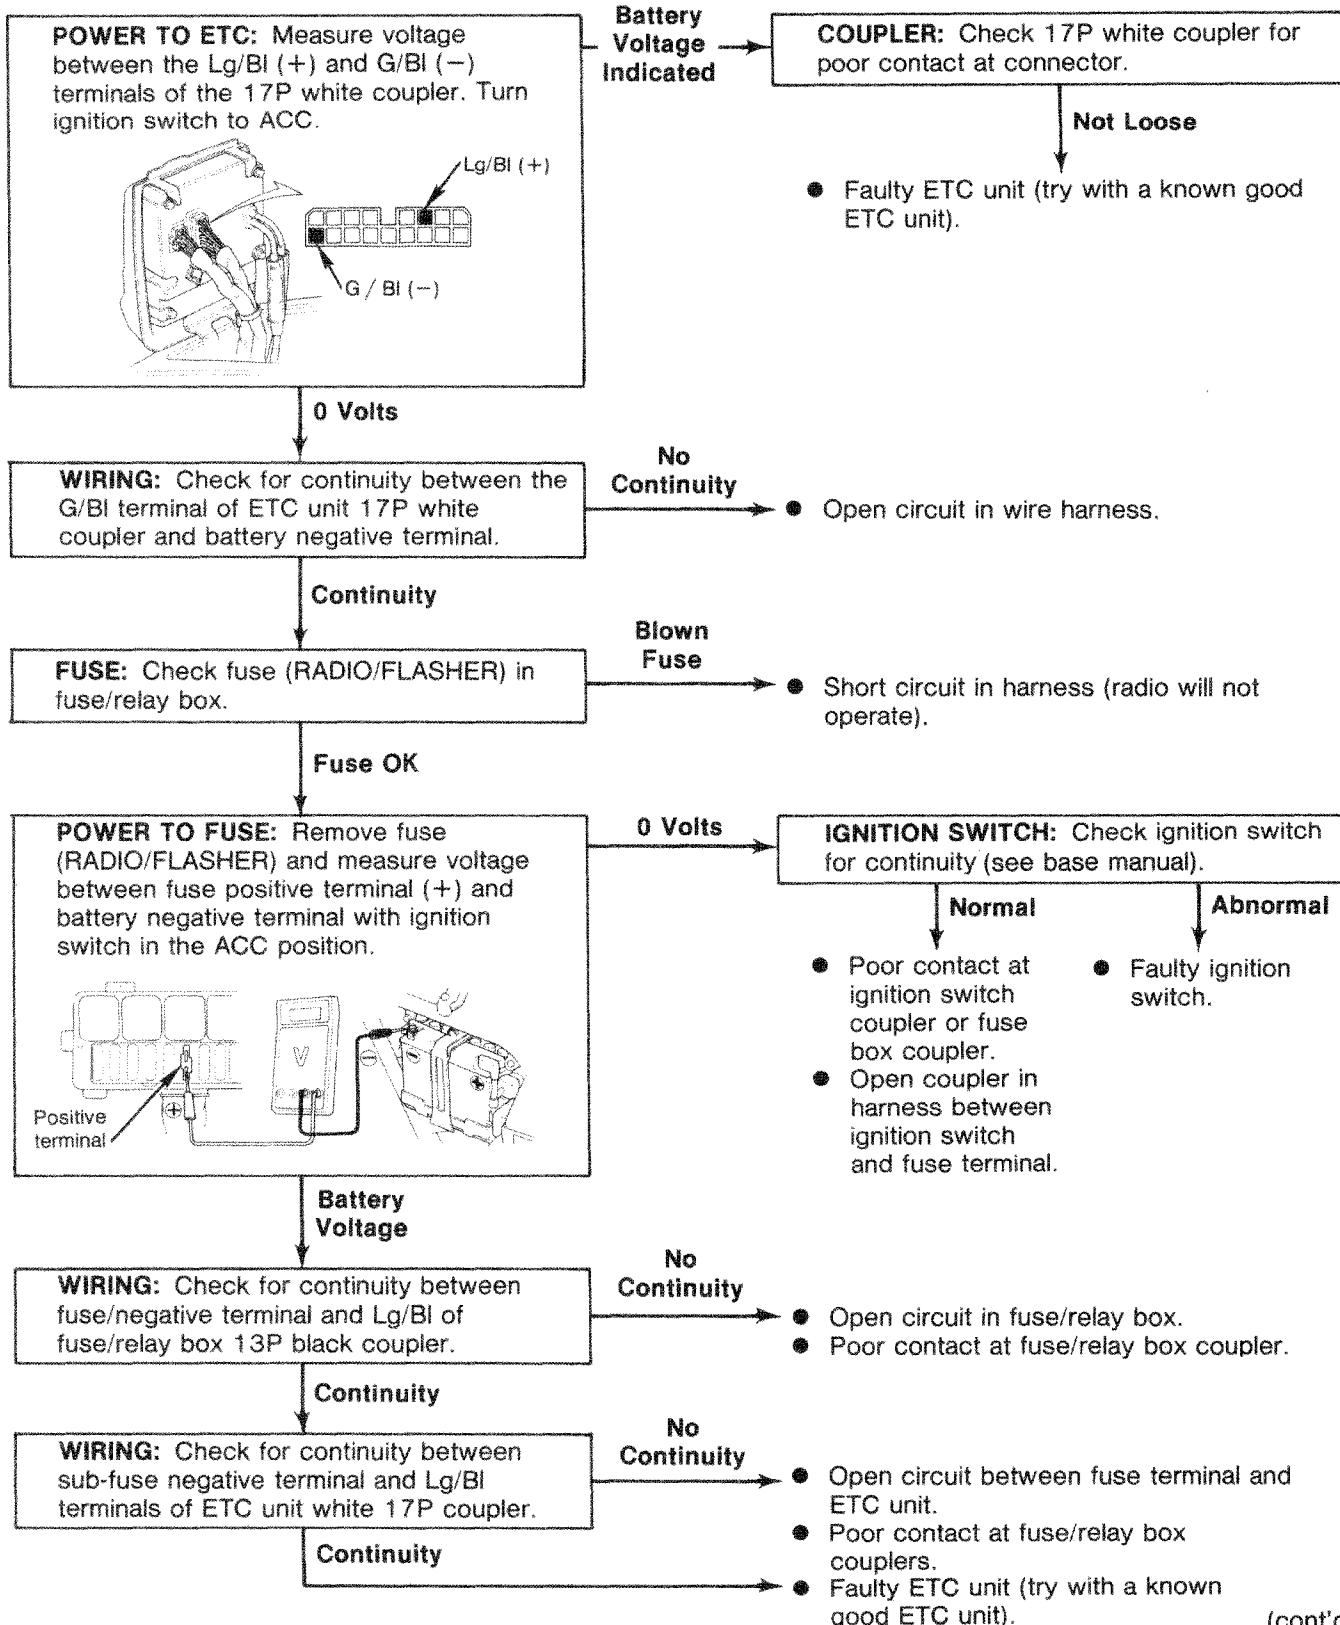

Troubleshooting

All liquid crystal displays (L.C.D.'s) remain OFF (including clock).

All liquid crystal displays (L.C.D.'s remain OFF (except clock).

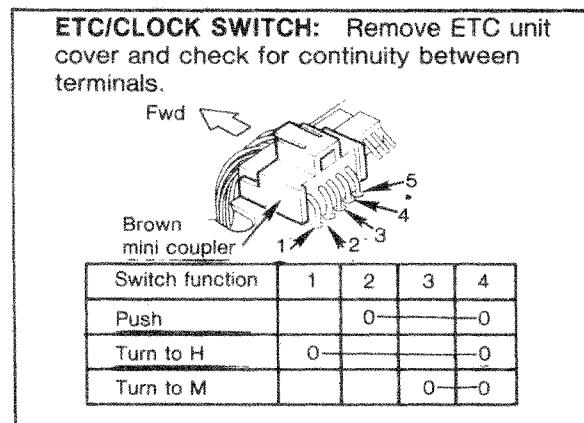

(cont'd)

Electronic Travel Computer

Troubleshooting (cont'd)

Time cannot be adjusted.

NOTE: The clock can only be adjusted when the ignition switch is in the ON or ACC position.

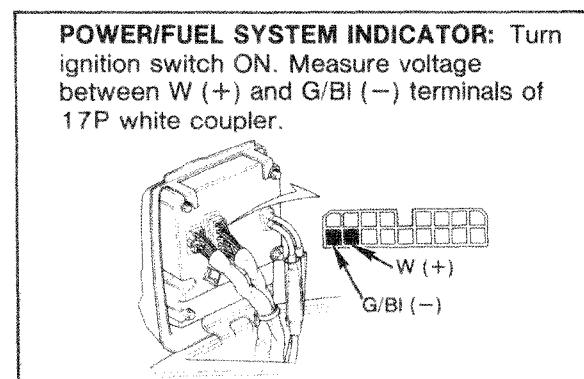

Abnormal

- Faulty clock switch.

Normal

- Faulty ETC unit (try with a known good ETC unit).

Average speed and trip functions do not operate.

0 Volts

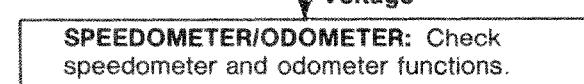

Check the fuel system indicator. The fuel system indicator should come on for about 3 seconds when the ignition is switched ON.

Abnormal

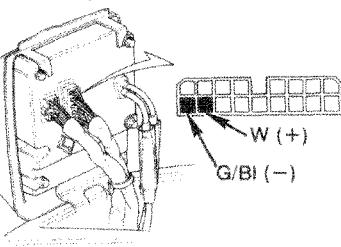

- Go to FUEL SYSTEM INDICATOR DOES NOT LIGHT troubleshooting (see page 10-7).

Normal

- Open circuit in wire harness.

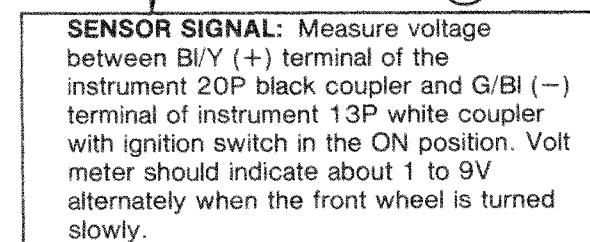

Battery Voltage

Abnormal

Normal

(B) (cont'd next page)

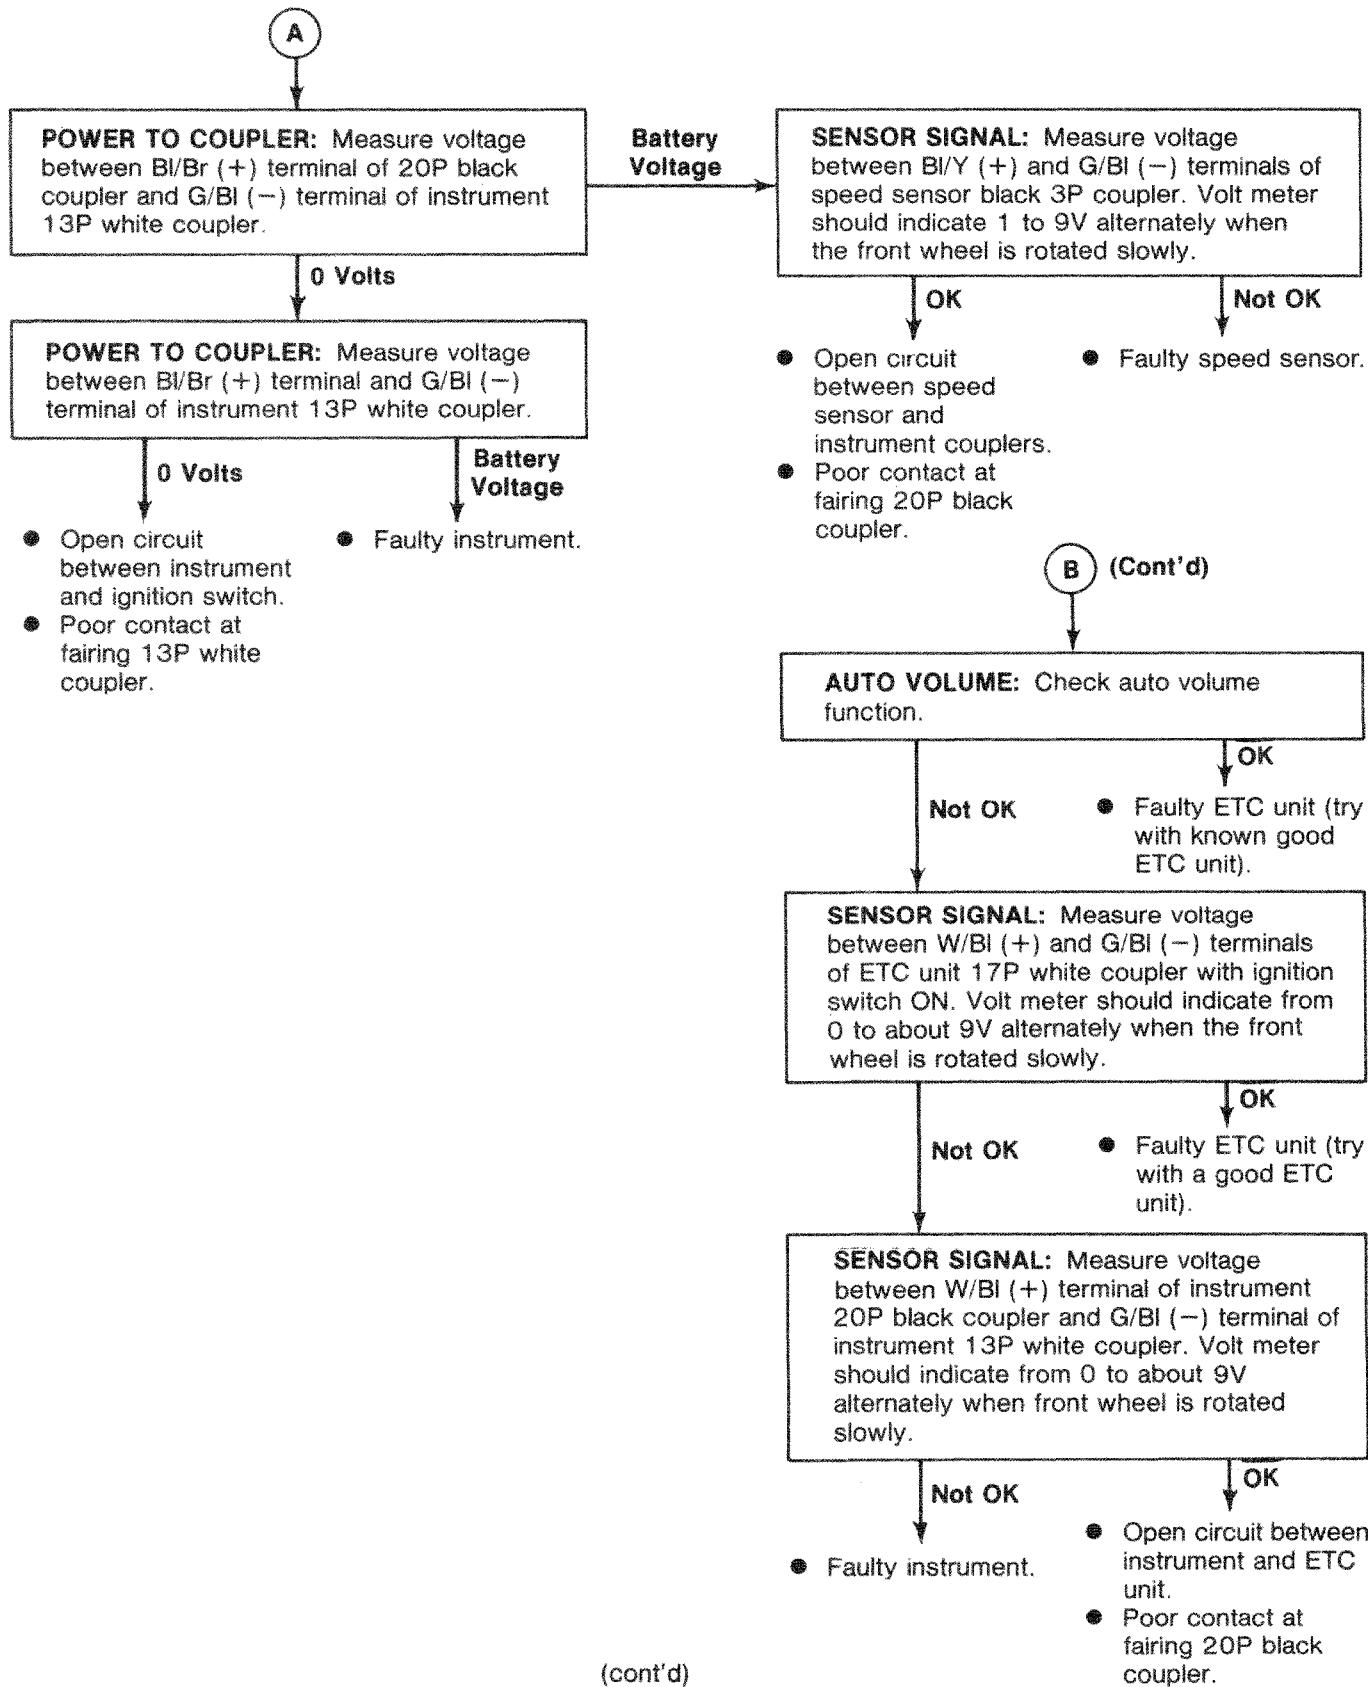

Not OK

OK

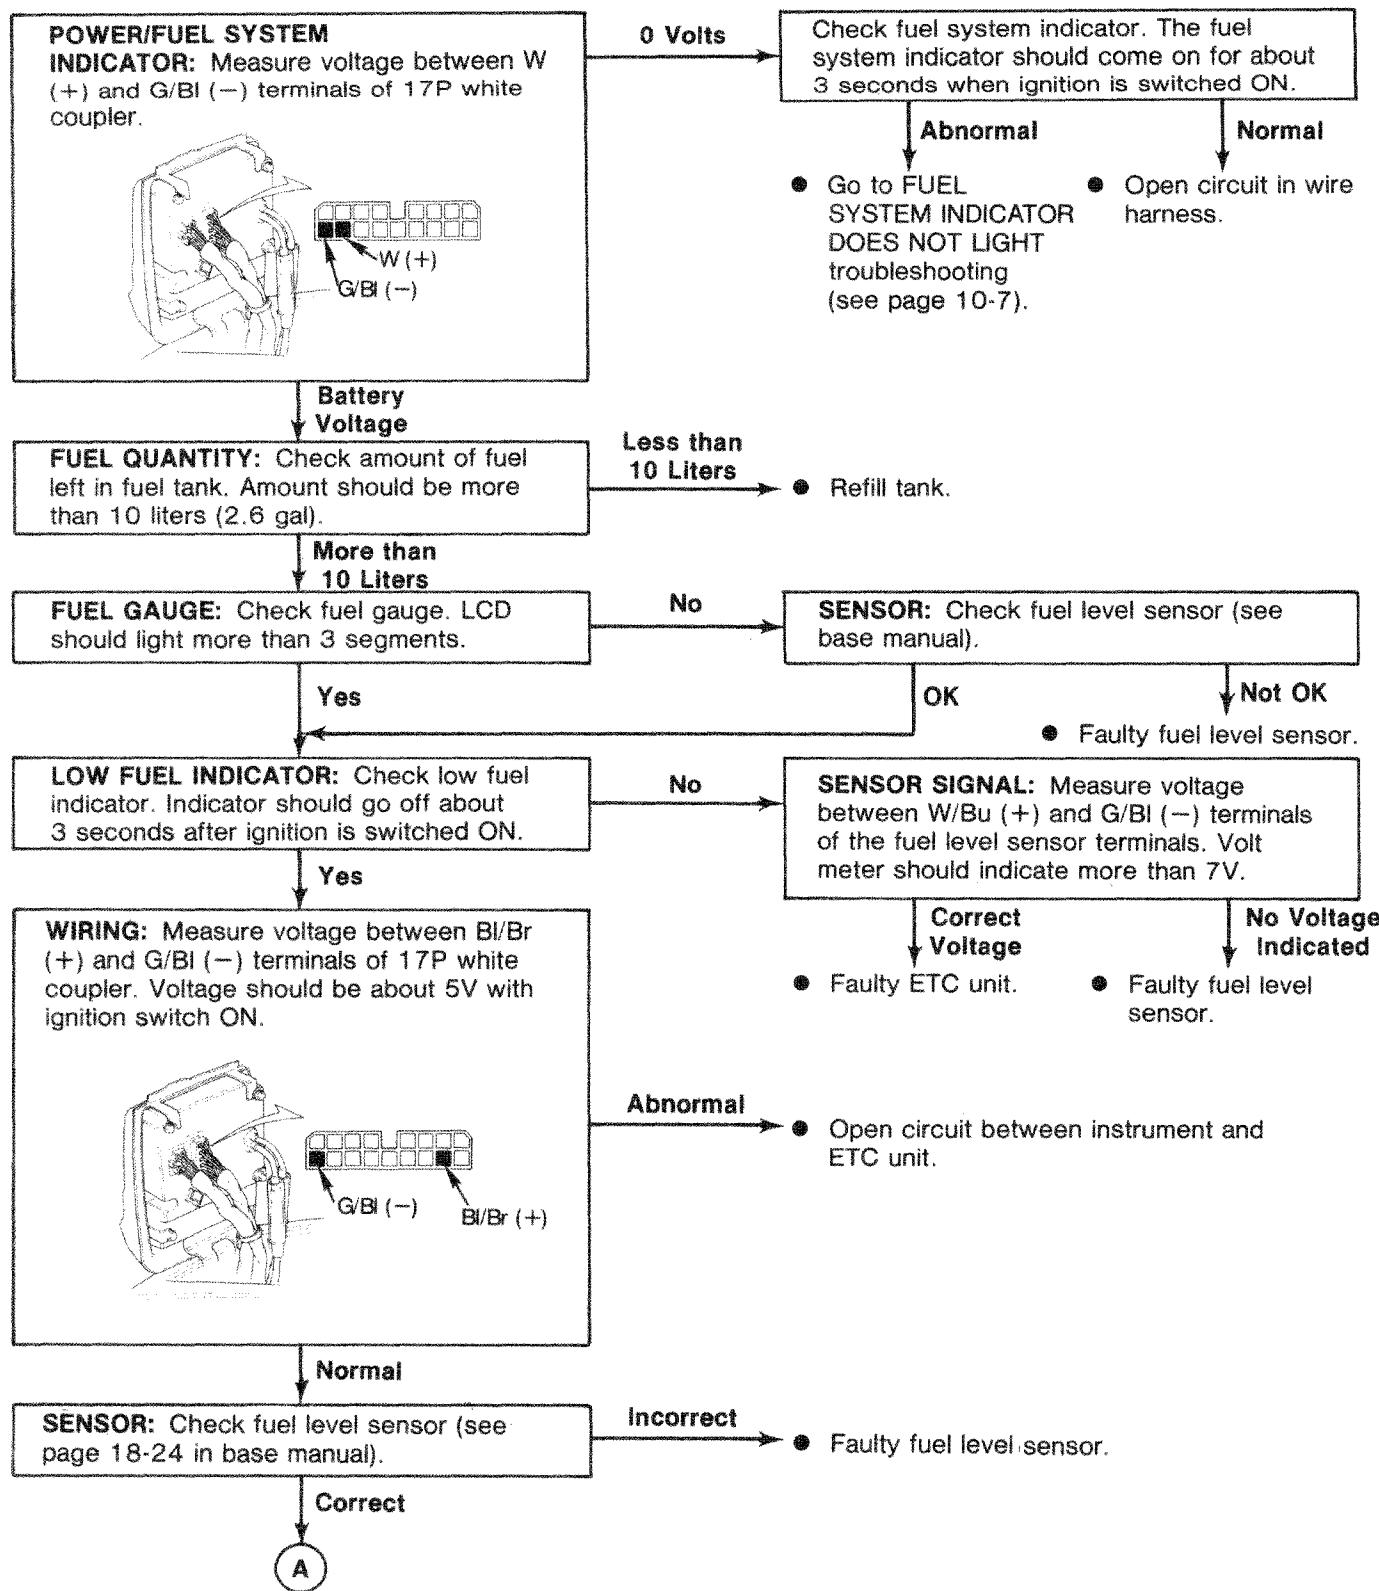

- Faulty instrument.

Electronic Travel Computer

Troubleshooting (cont'd)

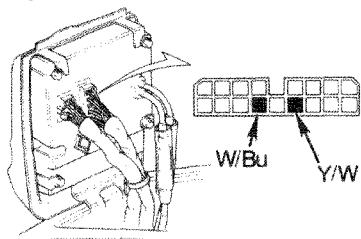

Fuel left in Tank is not indicated with ignition switch ON.

A

WIRING: Check W/Bu and Y/W wires for continuity between fuel level sensor and ETC 17P couplers. Ohmeter should indicate continuity between same color, and no continuity between different colors or body ground.

Incorrect

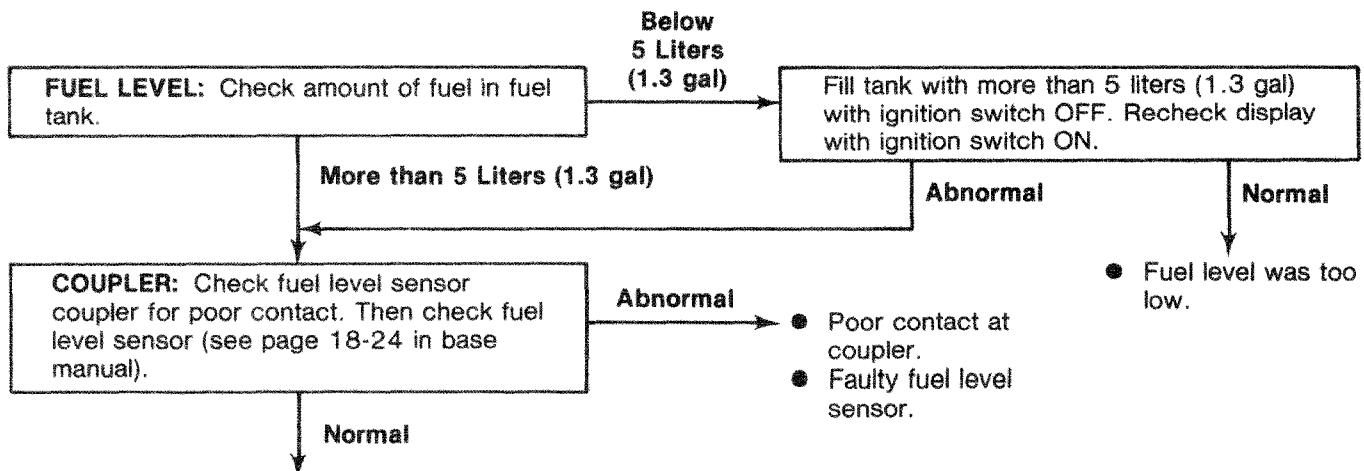

- Open or short circuit in wire harness.

Correct

- Faulty ETC unit.

ABNORMAL INDICATIONS

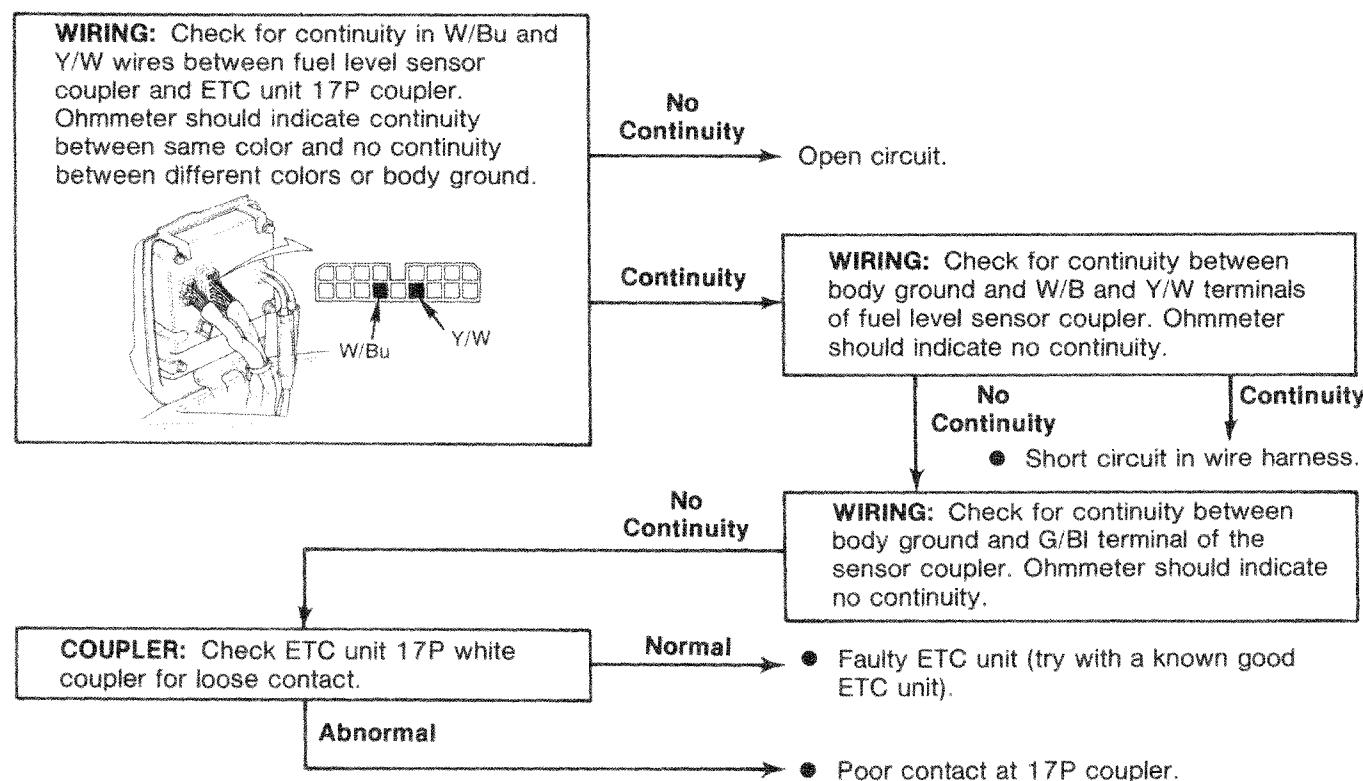

Four bars “— — — —” flashing at display in QTY and RANGE functions.

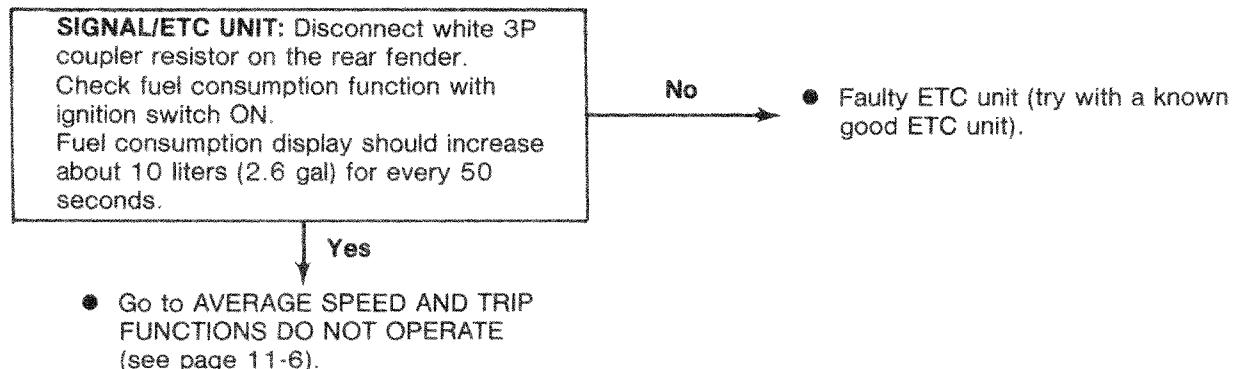

(cont'd)

Electronic Travel Computer

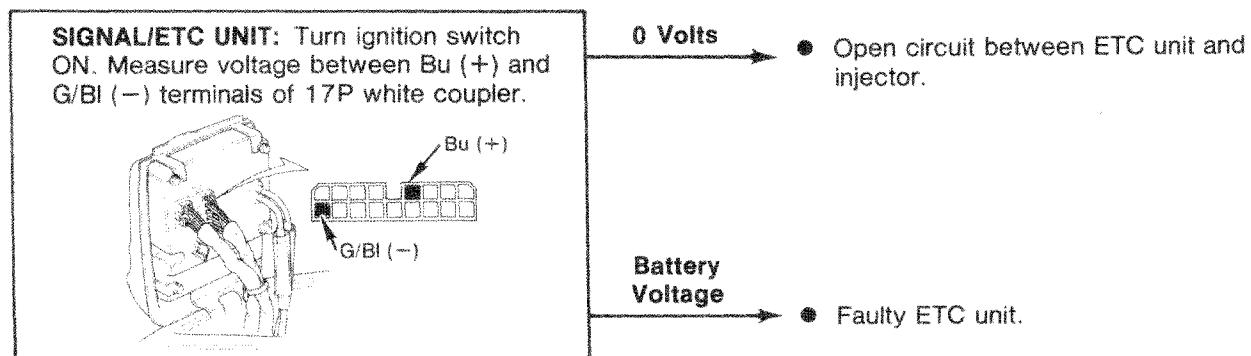

Troubleshooting (cont'd)

Fuel consumption does not decrease on display.

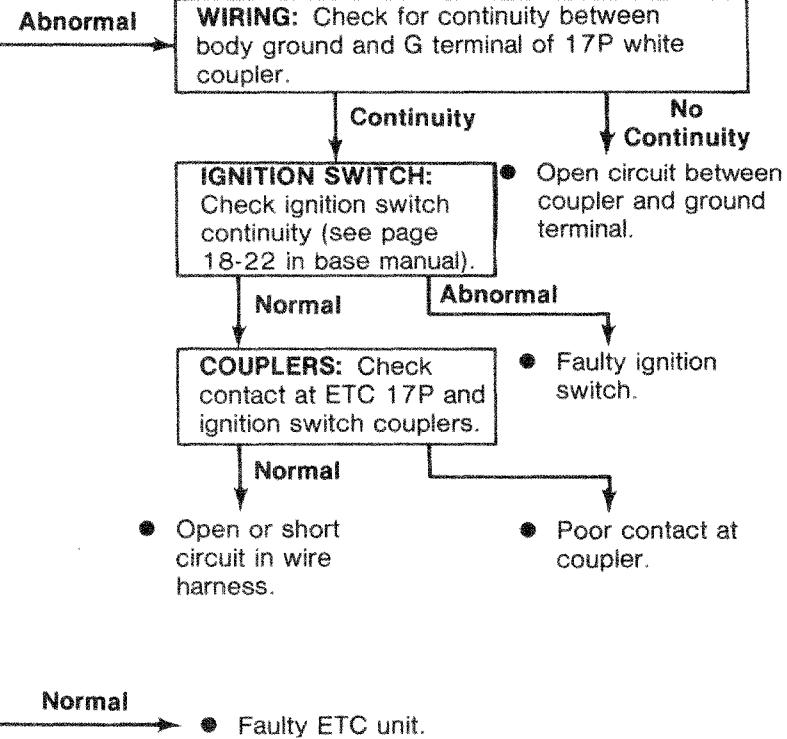

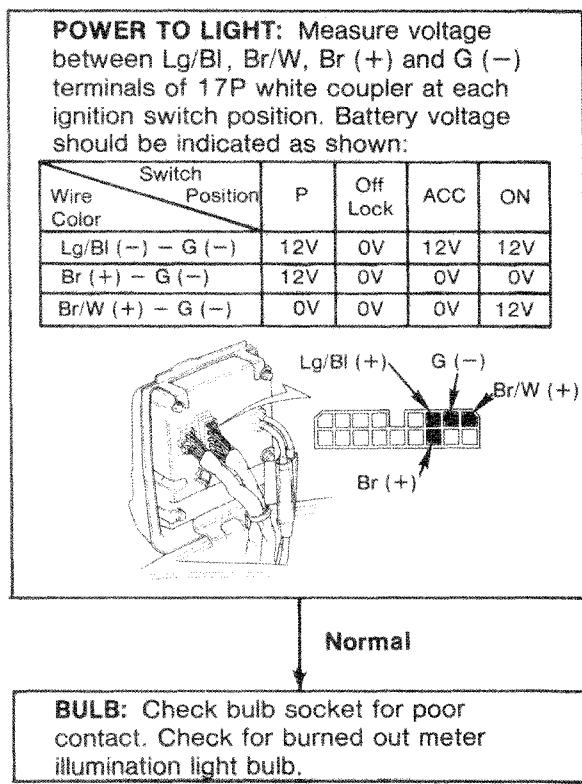

Excessive fuel consumption displayed.

LCD night light does not come on.

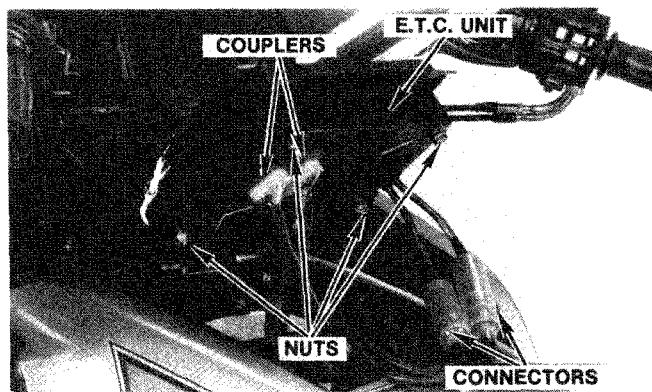

Electronic Travel Computer

Removal

Open the top compartment cover.

Disconnect the couplers and connectors from the E.T.C. unit.

Remove the four mounting nuts which secure the E.T.C. unit.

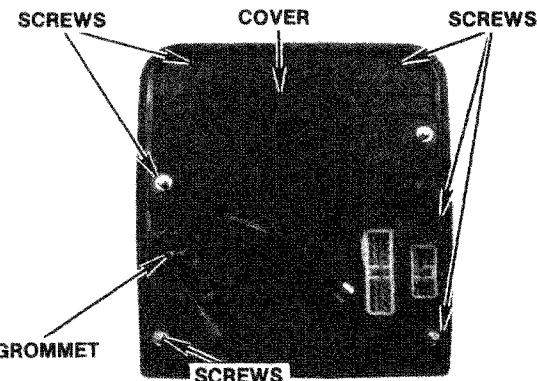

Disassembly

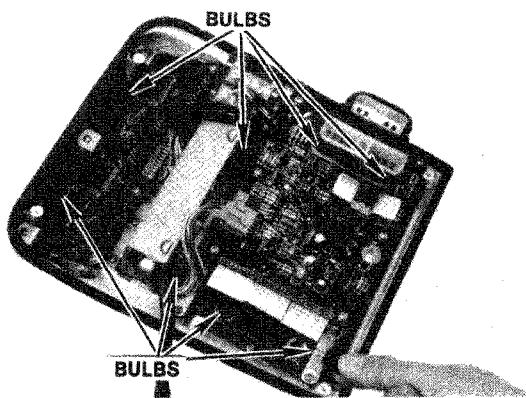

CAUTION: Keep water and dirt away from the printed board and other parts.

Unscrew the six cover mounting screws.

Press the wire grommet down into the cover. Remove the cover.

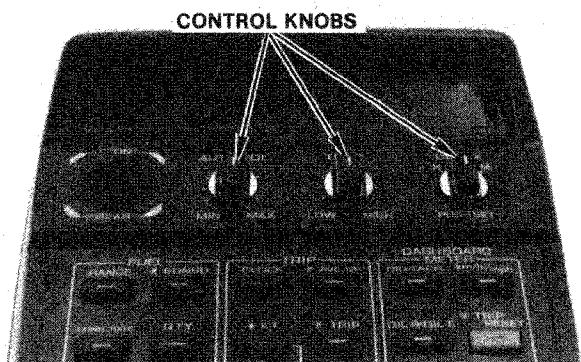

Remove the illumination bulbs by turning the sockets counterclockwise.

Remove the control knobs only if replacing the audio controls.

Remove the six top screws and unplug the controller coupler from the top printed board.

Remove the top printed board from the fader coupler by removing the two screws.

NOTE: Be careful not to damage the taped harness between printed boards during disassembly. Do not remove the base printed board.

Disconnect the black LCD indicator coupler from the printed board.

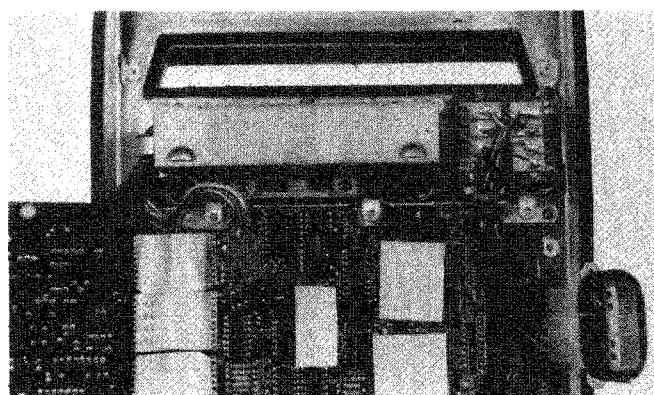

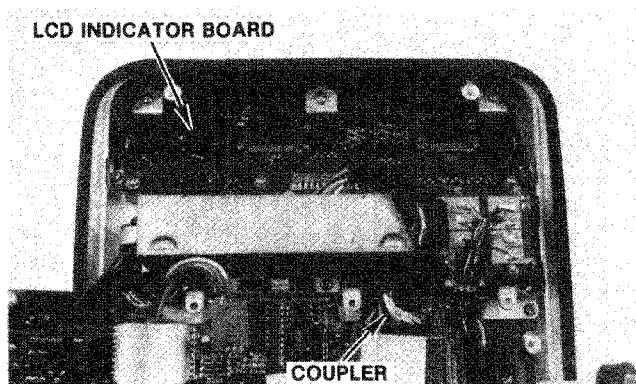

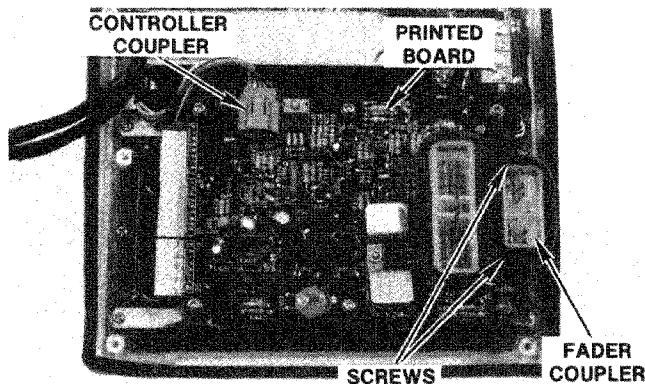

Release the LCD indicator from the case by removing the seven self-tapping screws.

Remove the screws, radio controller and fader.

Remove the screws which secure the printed boards.

Remove the water shield and buttons from the case.

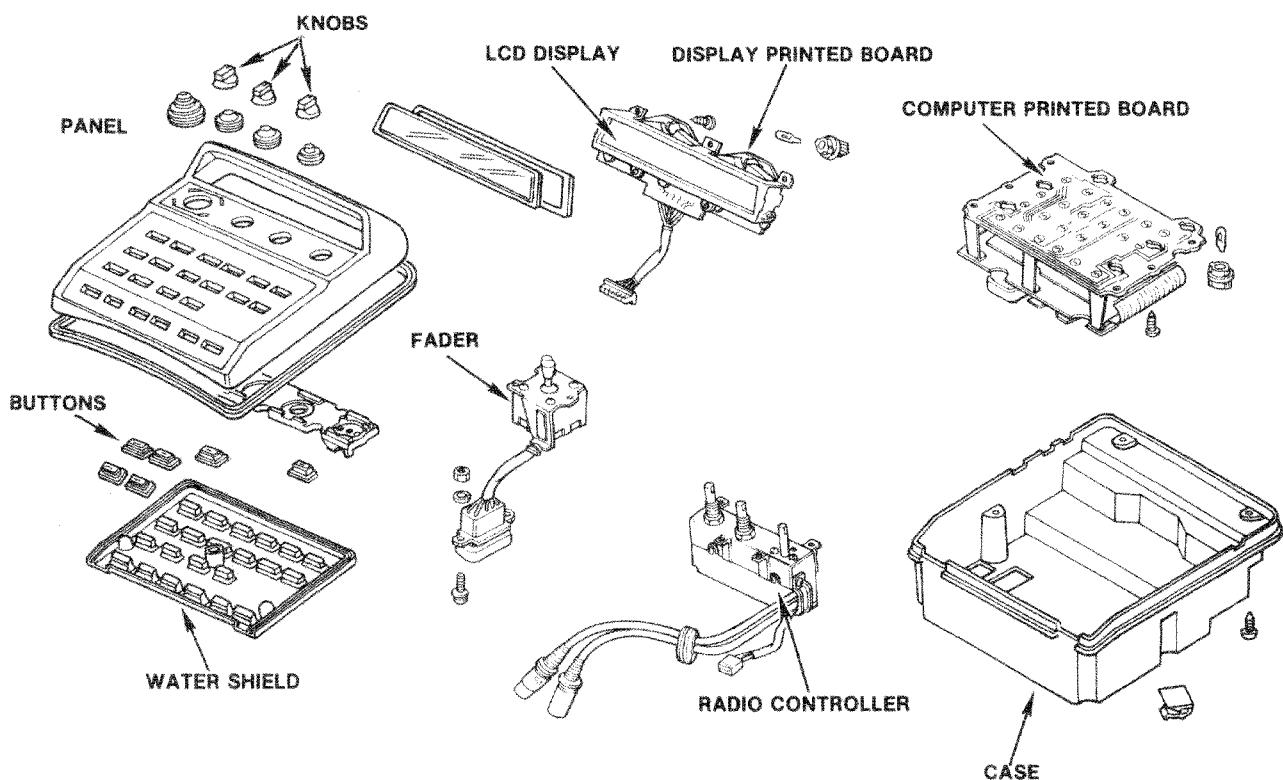

NOTE: Record the button colors and note the location of paper insulators as they are removed so they can be reinstalled in their original locations.

Electronic Travel Computer

Assembly

Assemble in the reverse order of disassembly.

Auto Leveling Rear Suspension Troubleshooting

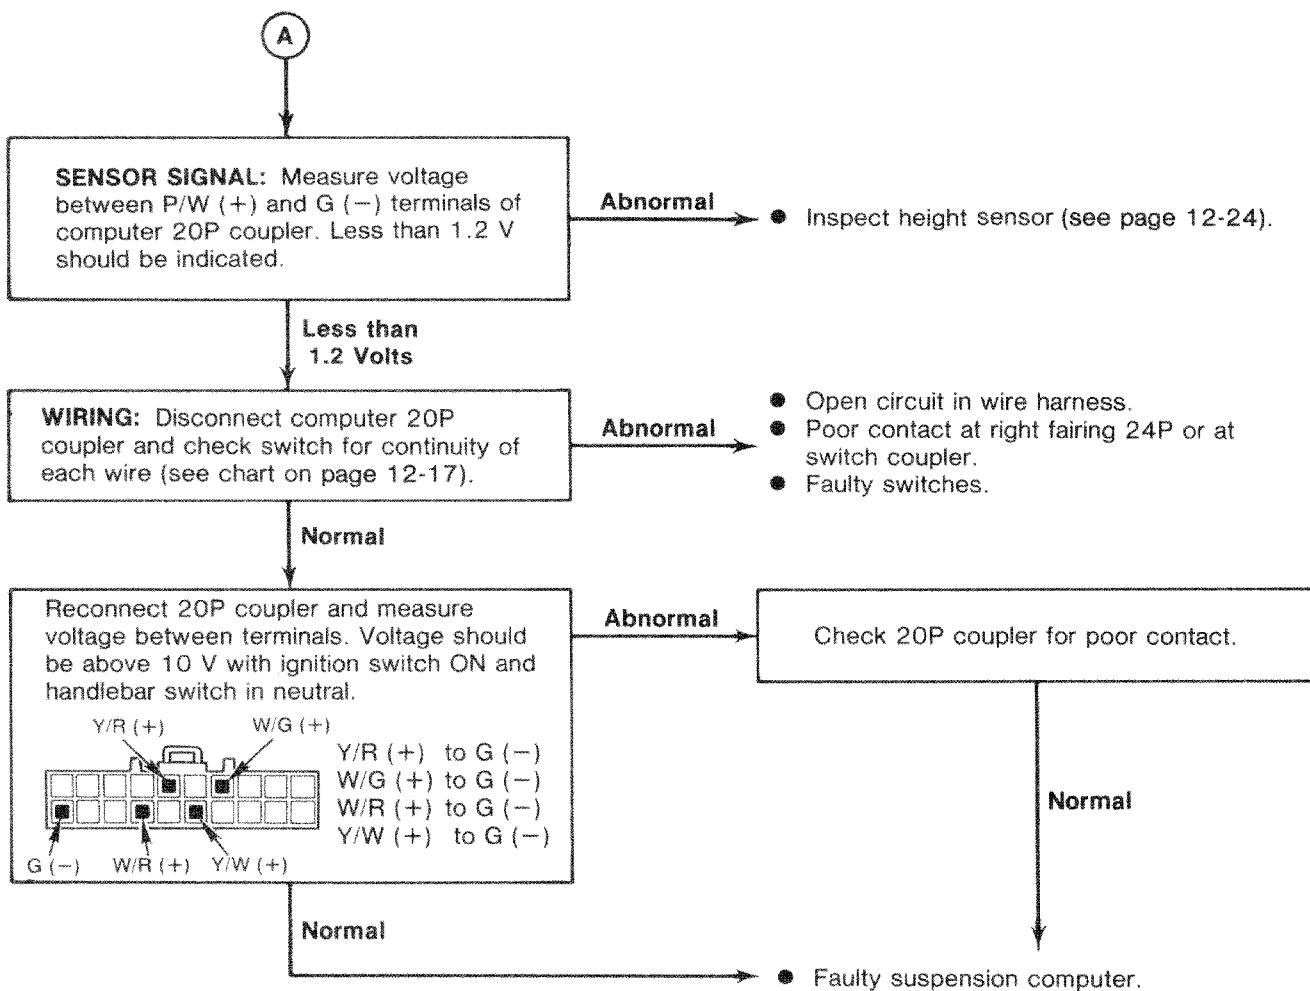

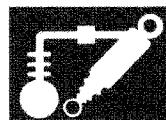

NOTE: Repeated pressure checks may cause air to leak gradually.

System does not operate.

NOTES:

- The system will not operate when the front or rear brake is applied.
- The system will stop automatically after about 90 seconds of operation.
- The system will not operate when battery voltage is below 10 V.

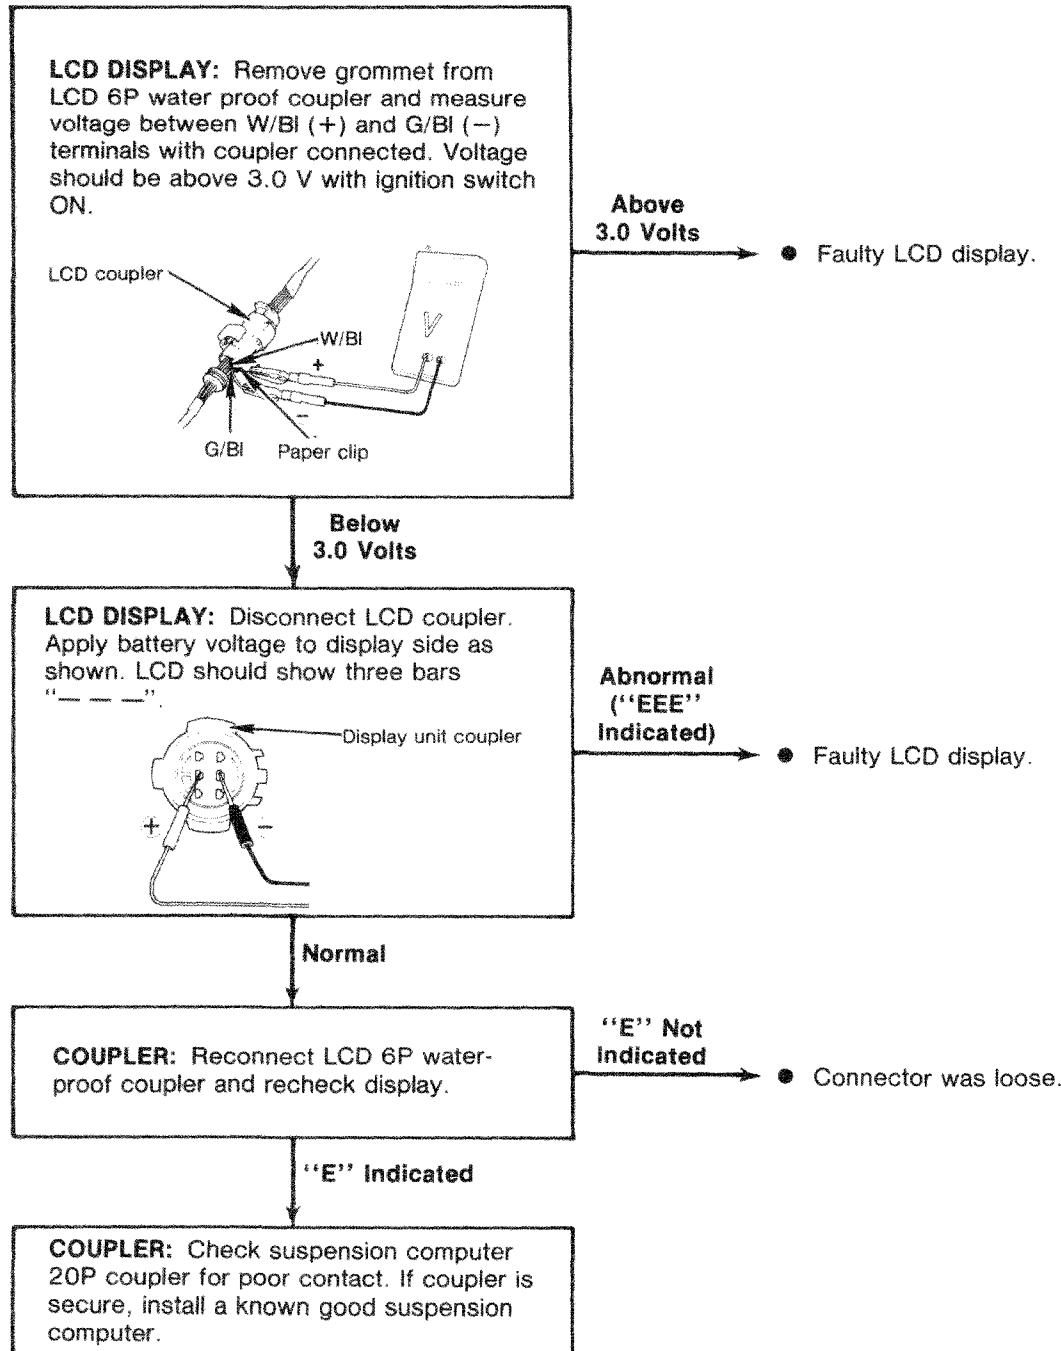

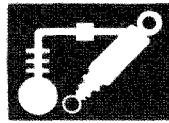

(cont'd)

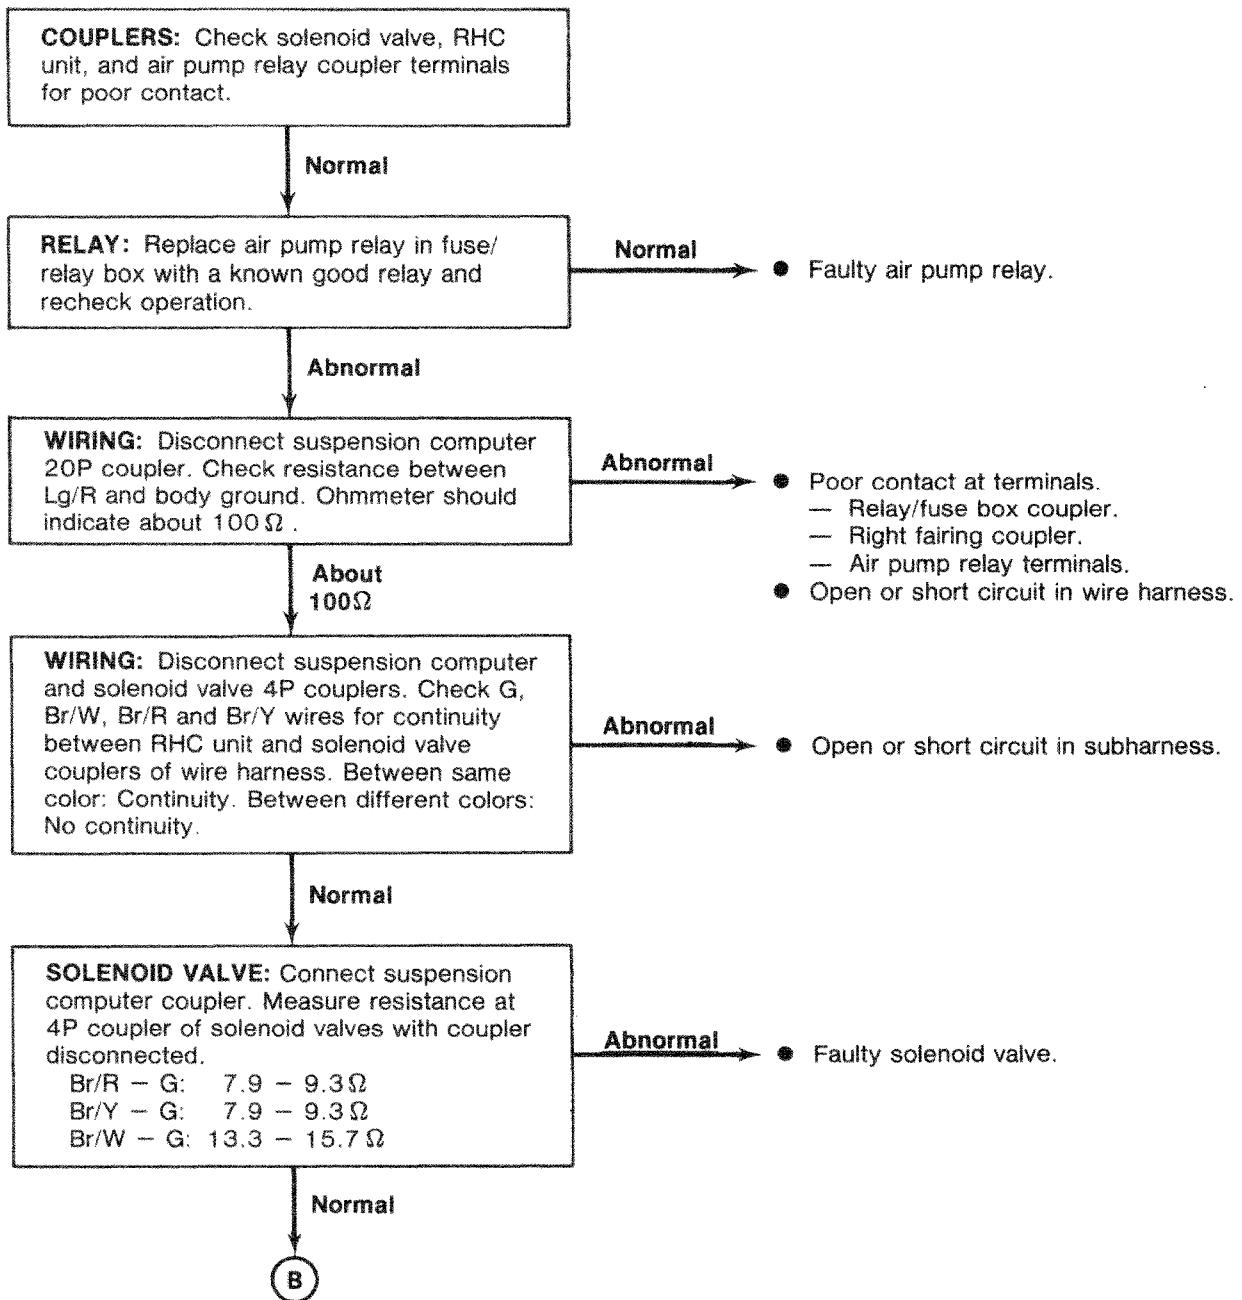

Auto Leveling Rear Suspension Troubleshooting (cont'd)

System does not operate, with "E" displayed.

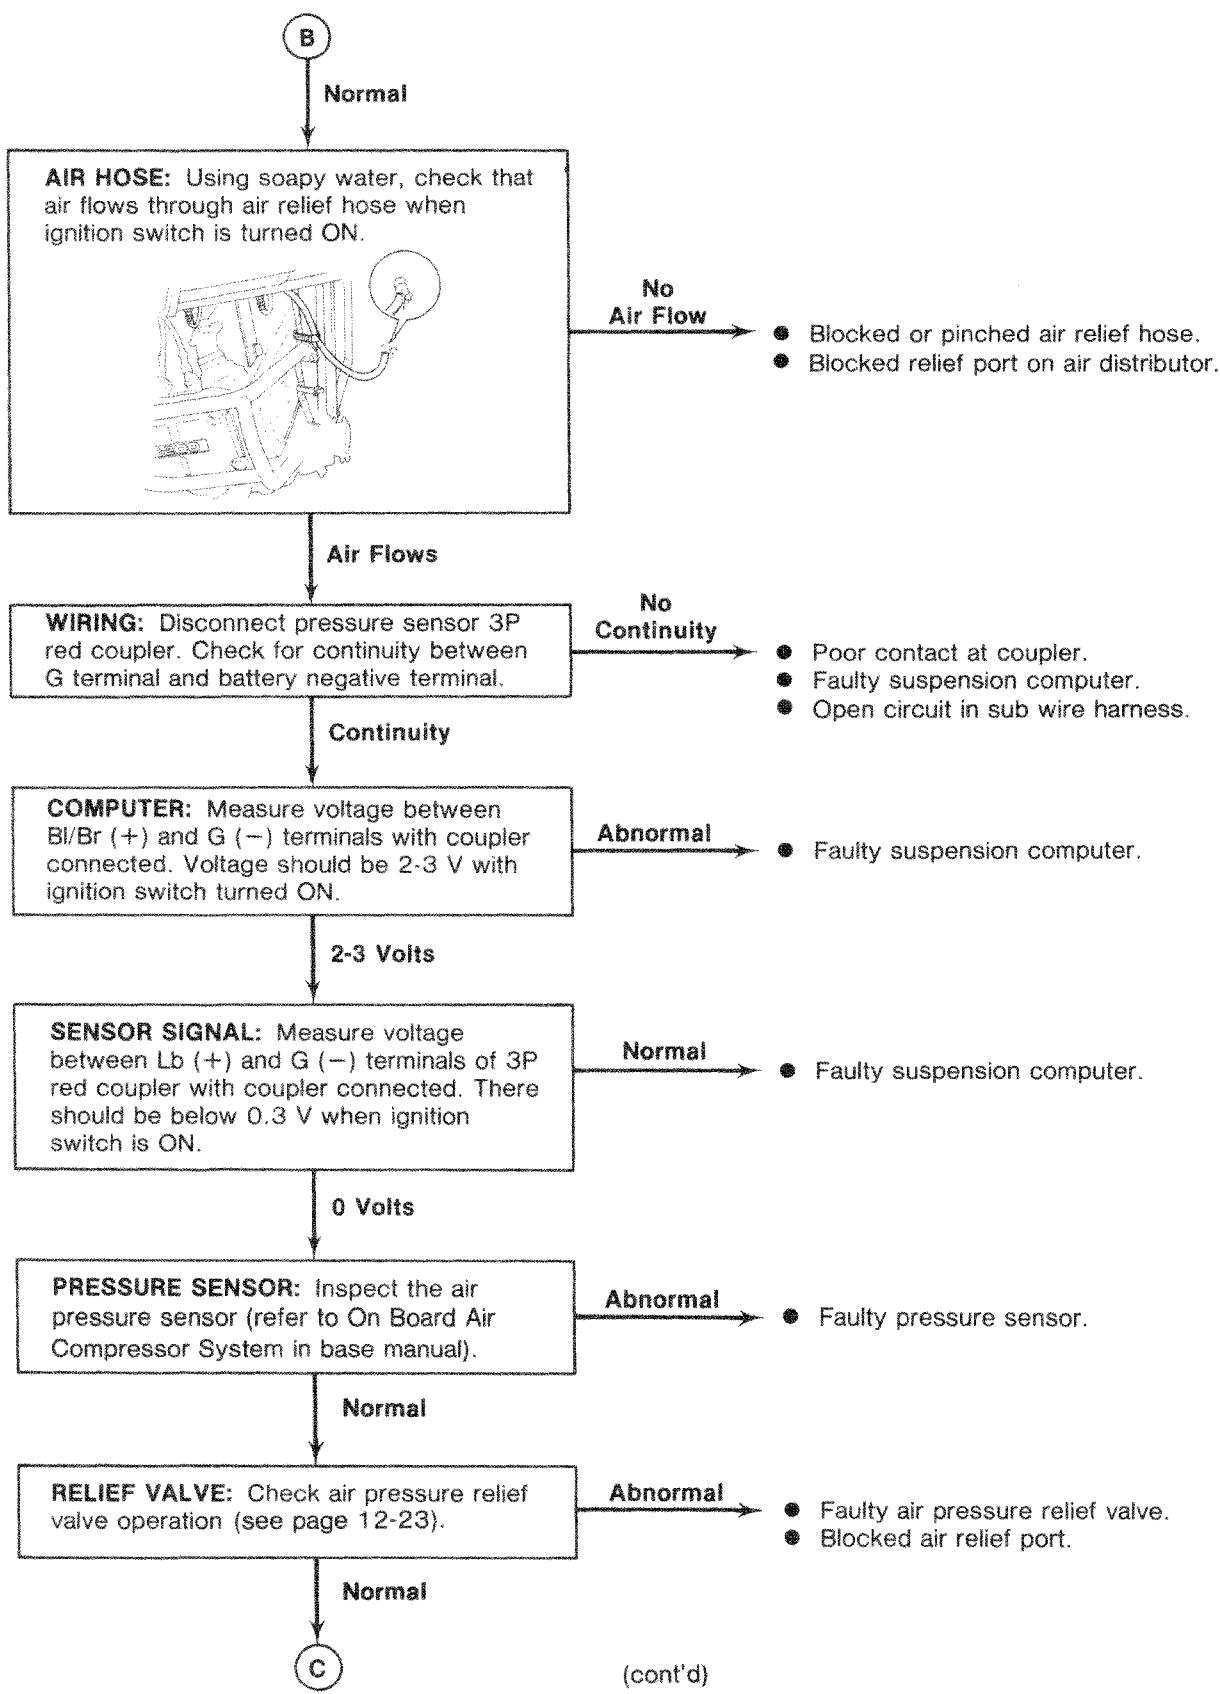

System does not operate, with "EEE" displayed.

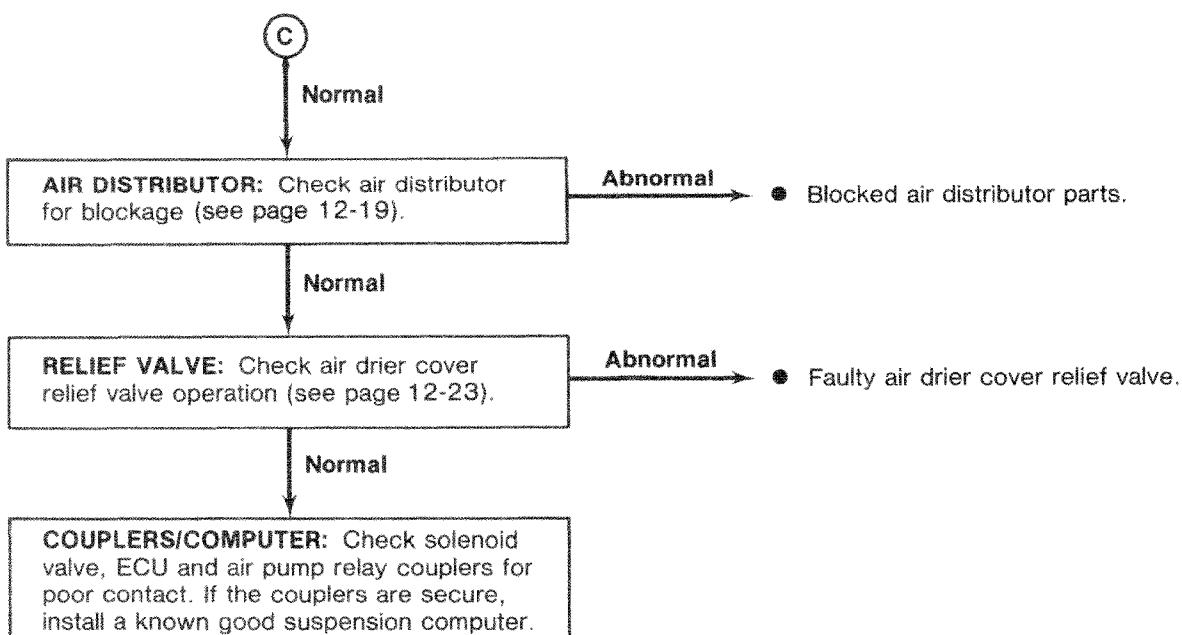

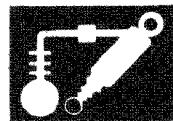

(cont'd)

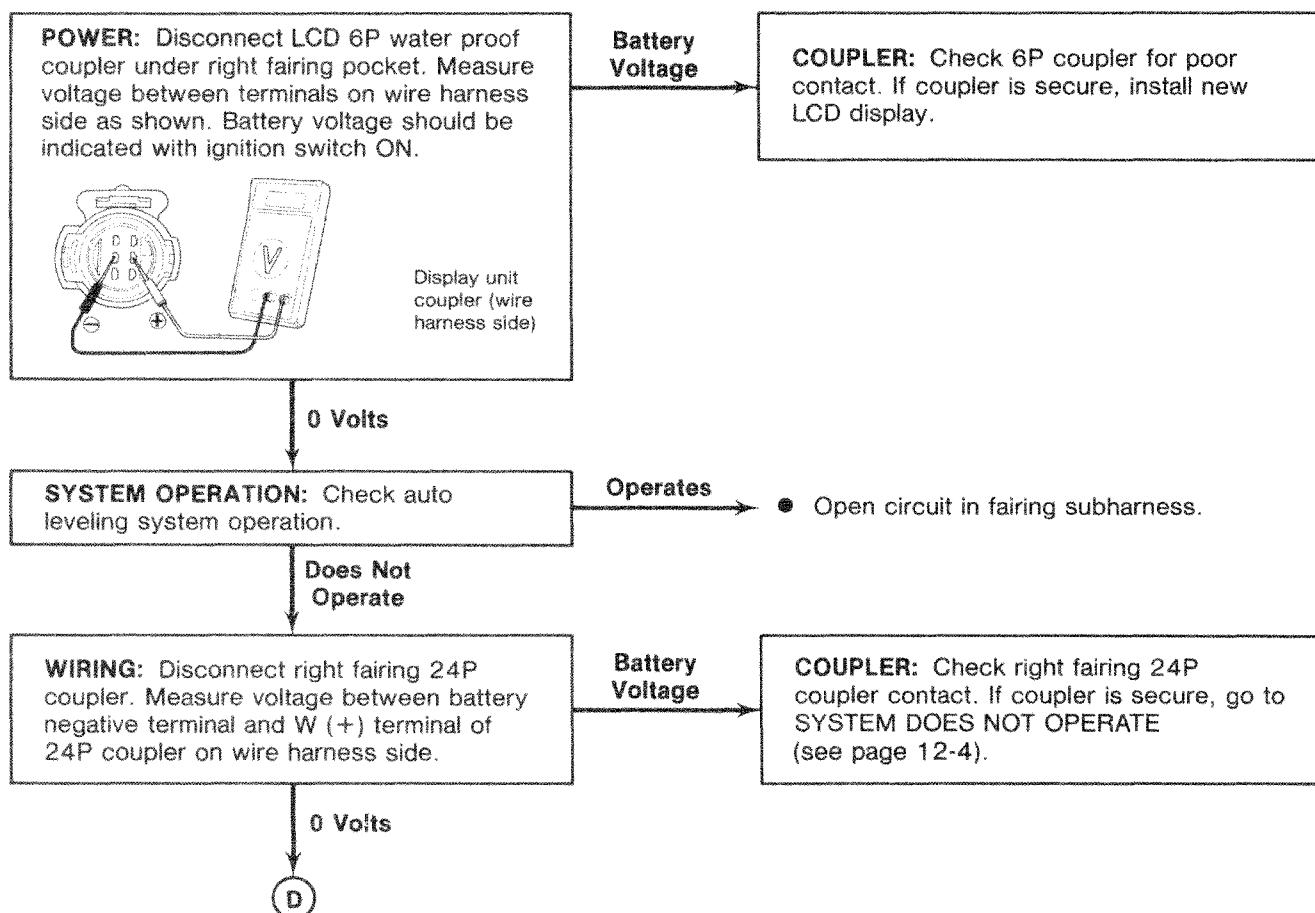

Auto Leveling Rear Suspension

Troubleshooting (cont'd)

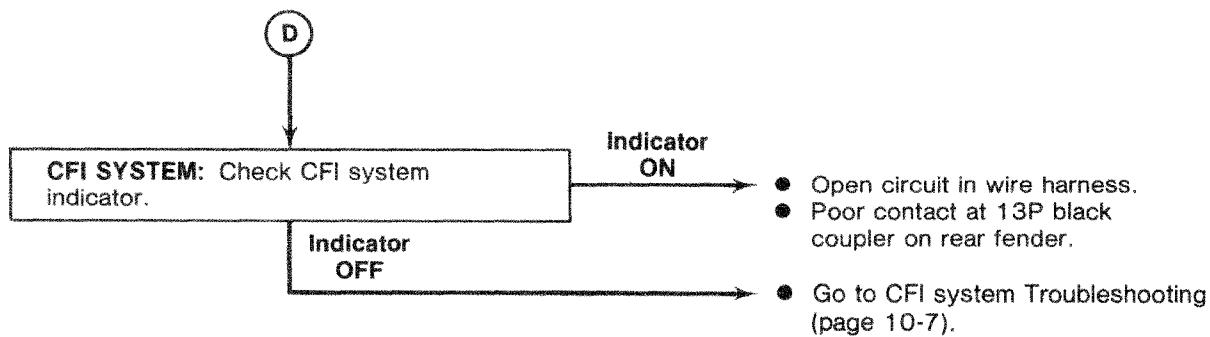

LCD does not display.

(cont'd)

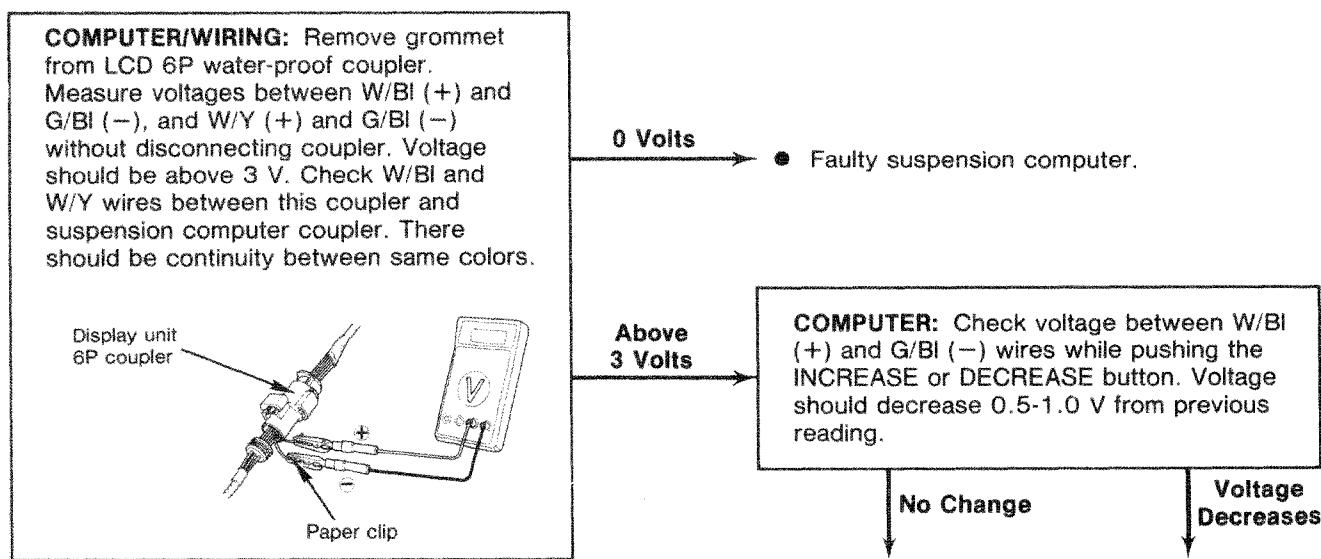

Auto Leveling Rear Suspension

Troubleshooting (cont'd)

ABNORMAL INDICATIONS

Liquid Crystal Displays indicate "— — — —" when pushing "INCREASE" or "DECREASE" button. Pressure indicated does not change. "AUTO LEVEL" is not indicated.

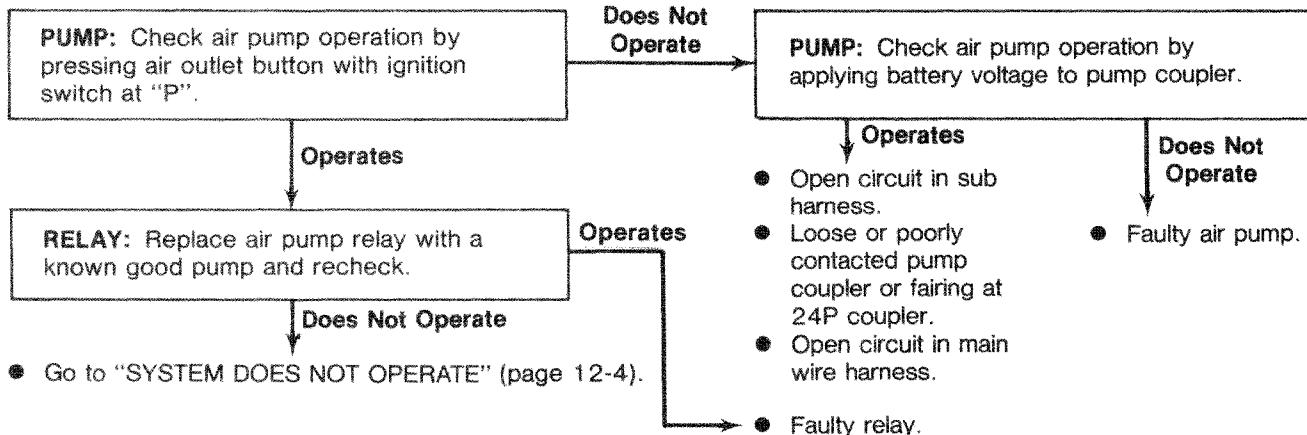

ABNORMAL INCREASE OPERATION.

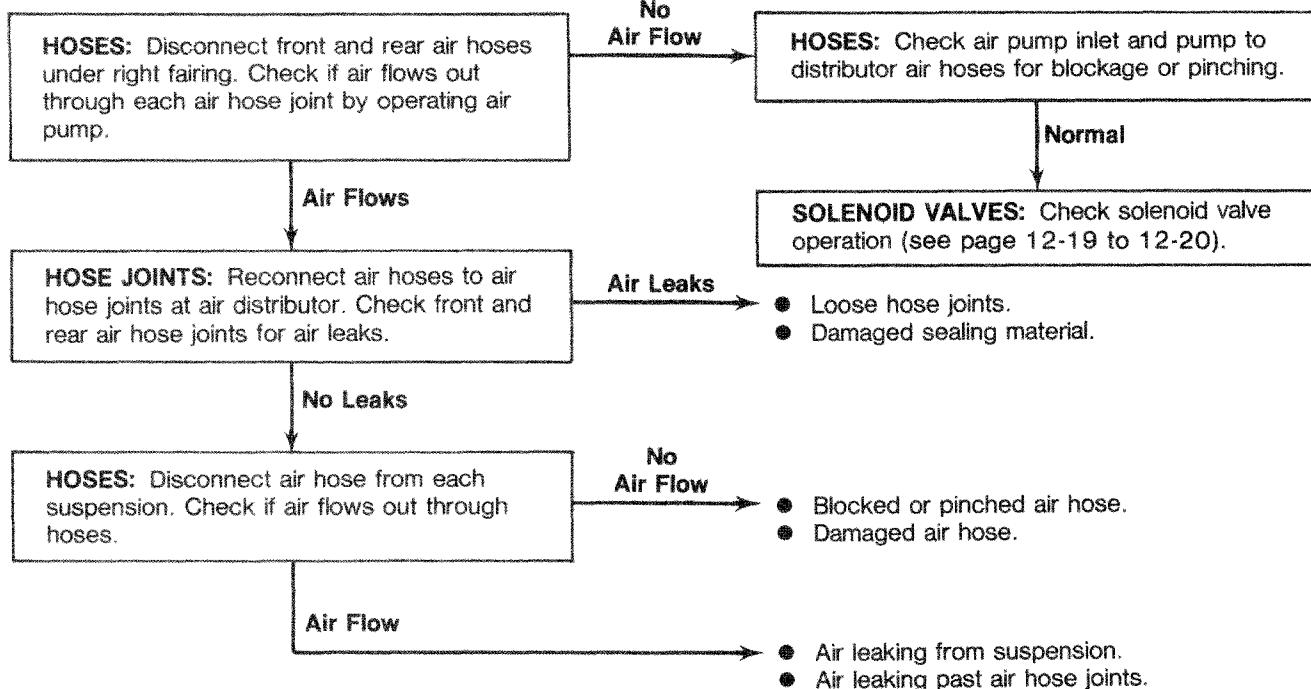

NOTES:

- System will not work when front or rear brake is applied.
- Air pump will stop automatically after about 90 seconds of operation.
- System does not operate when battery voltage is below 10 V.
- Air will stop increasing automatically at 10 kg/cm² (14 psi) for front, and 6.5 kg/cm² (92 psi) for rear.

Pump does not operate.

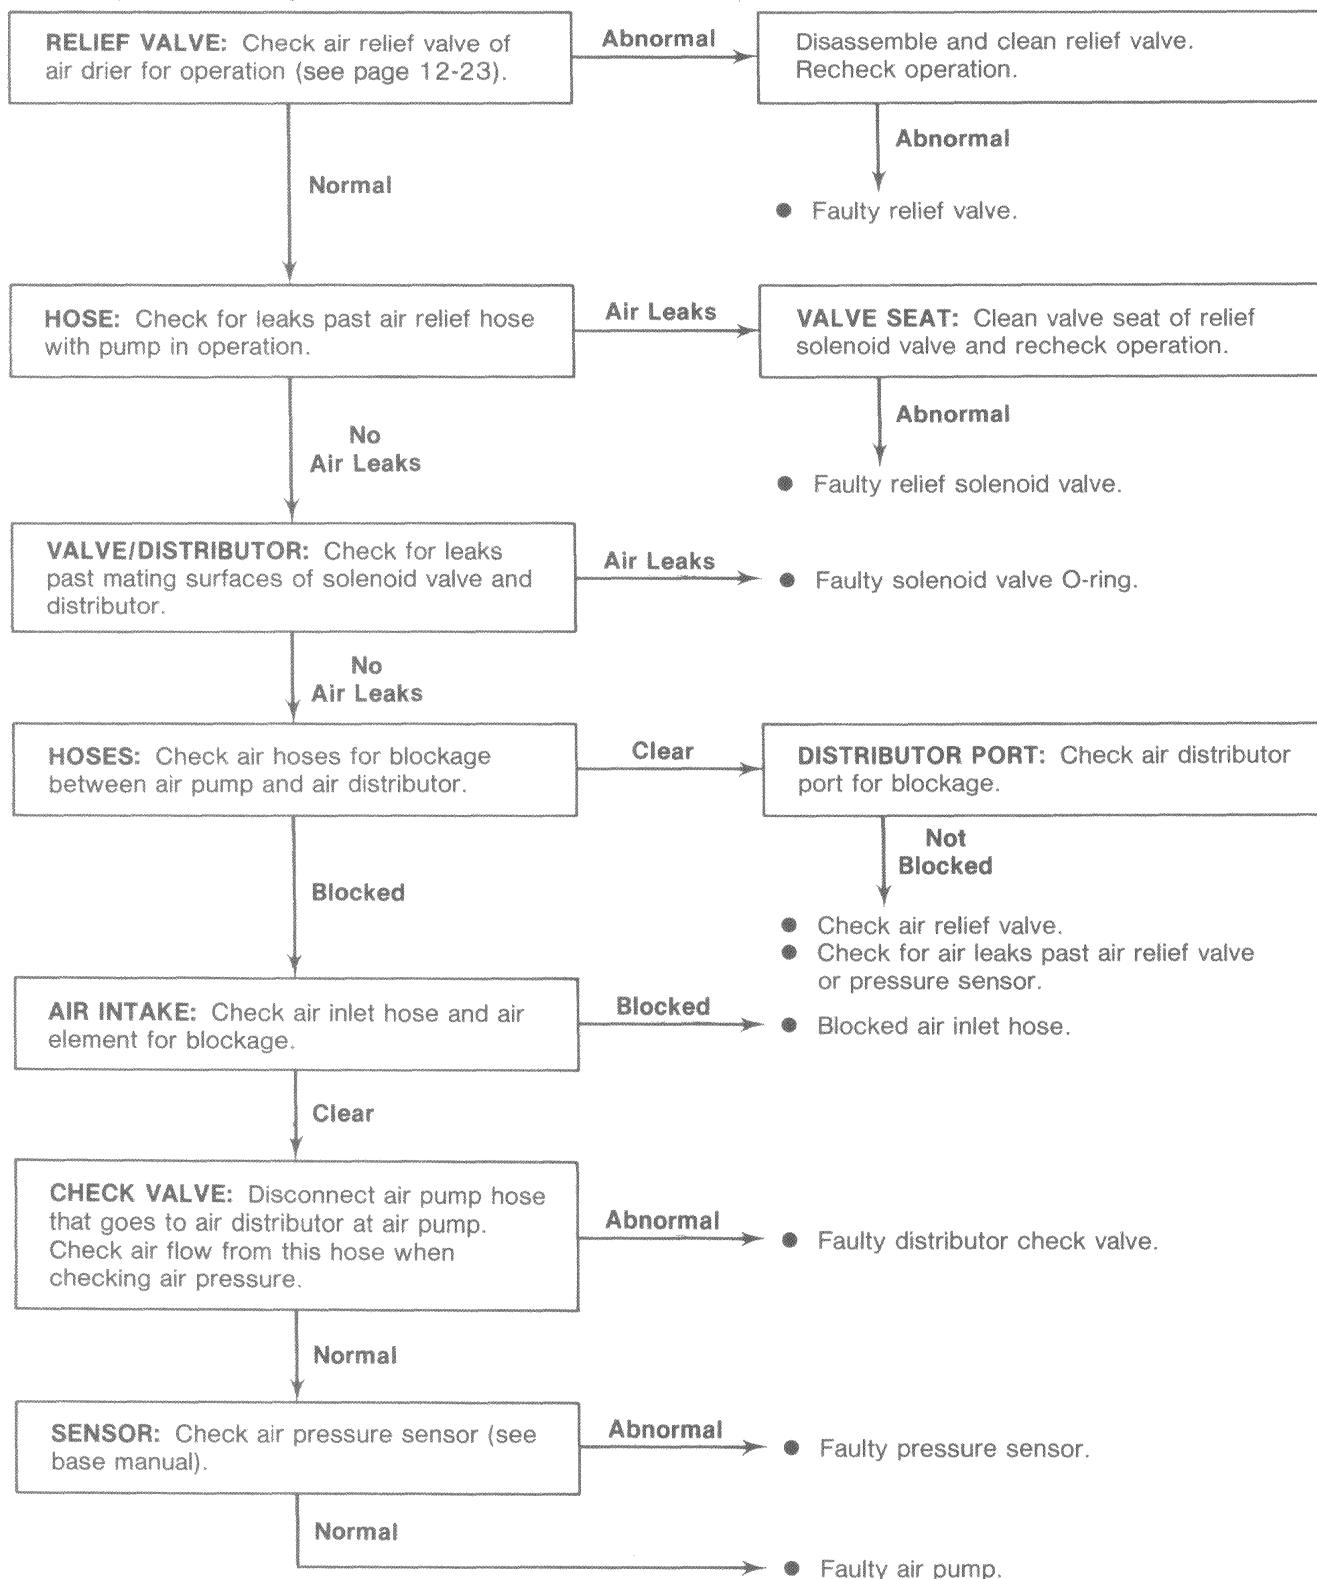

Pump operates — LCD shows increase, but system doesn't respond.

(cont'd)

Auto Leveling Rear Suspension Troubleshooting (cont'd)

Pump operates but pressure does not increase.

Front air pressure equalized with rear pressure.

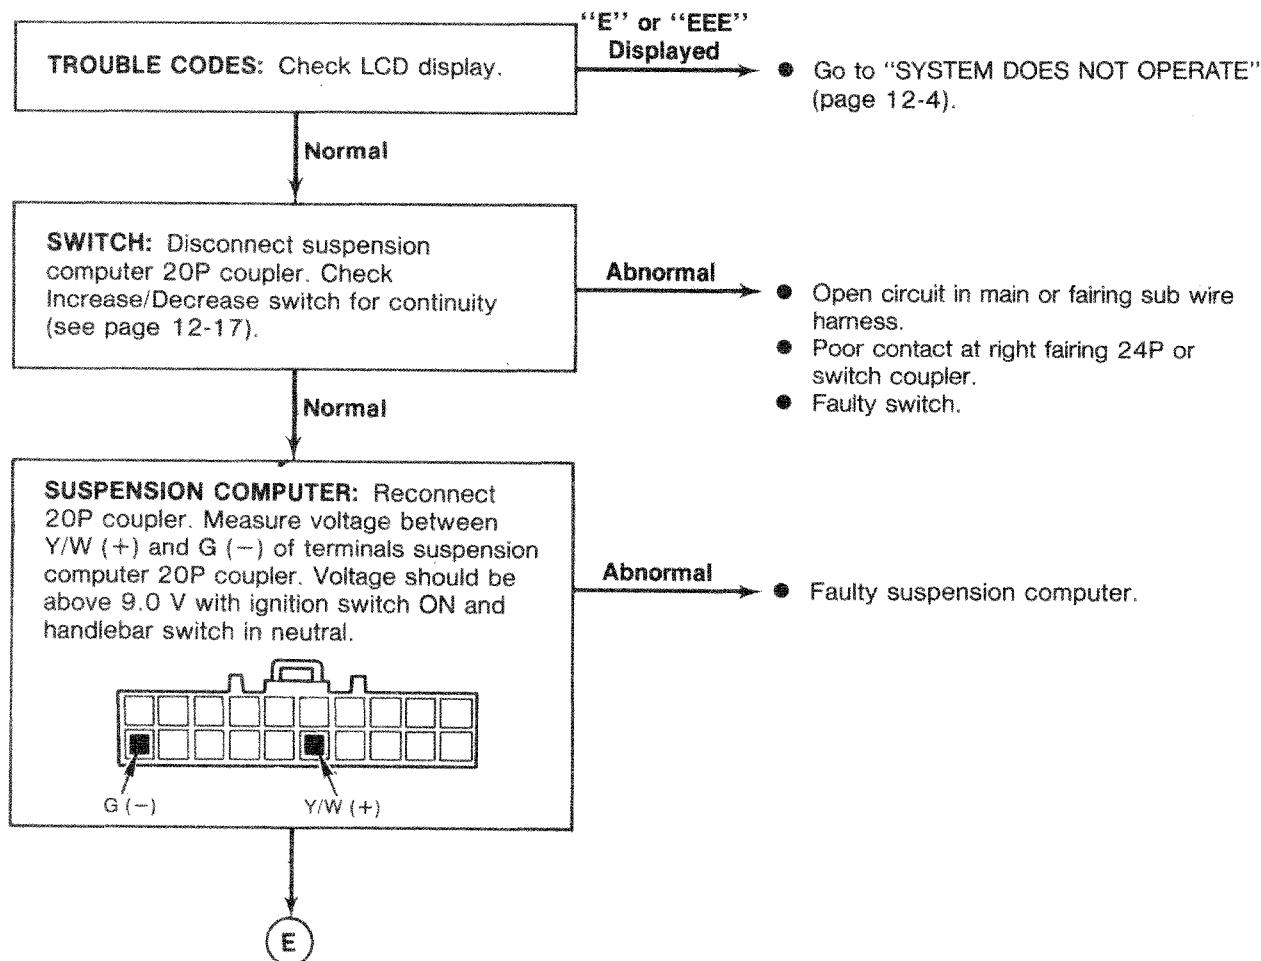

ABNORMAL DECREASE OPERATION

Pressure will not decrease.

NOTES:

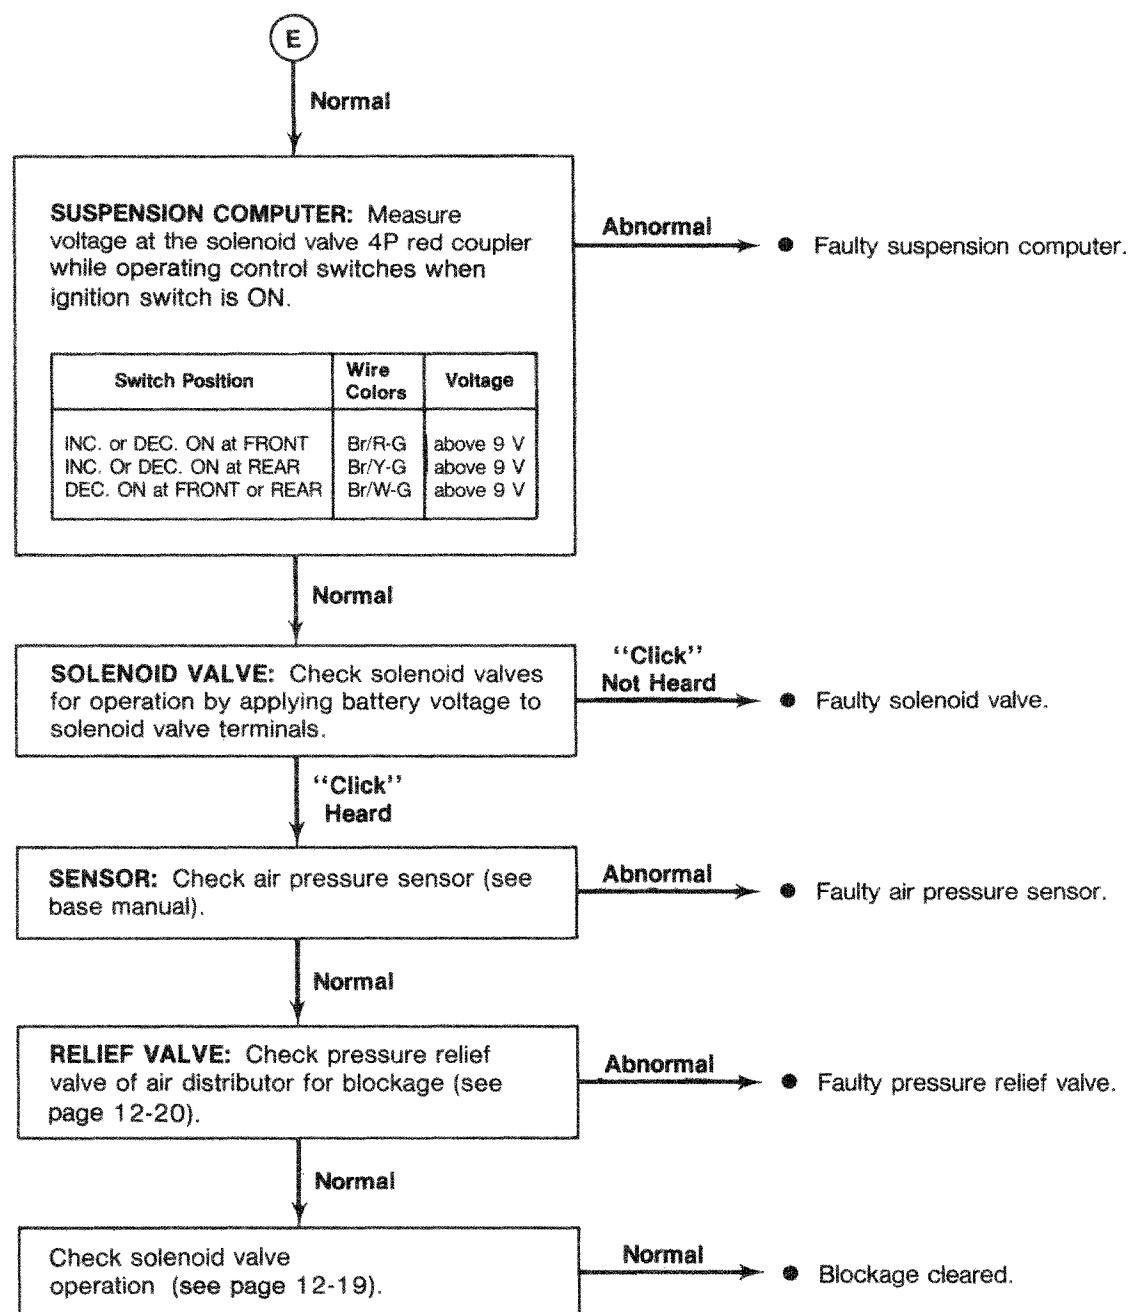

- Air stops decreasing if front or rear brake is applied or battery voltage is below 10 V.
- Air stops decreasing when 2.0 kg/cm² (28 psi) has been reached.

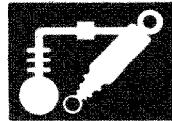

(cont'd)

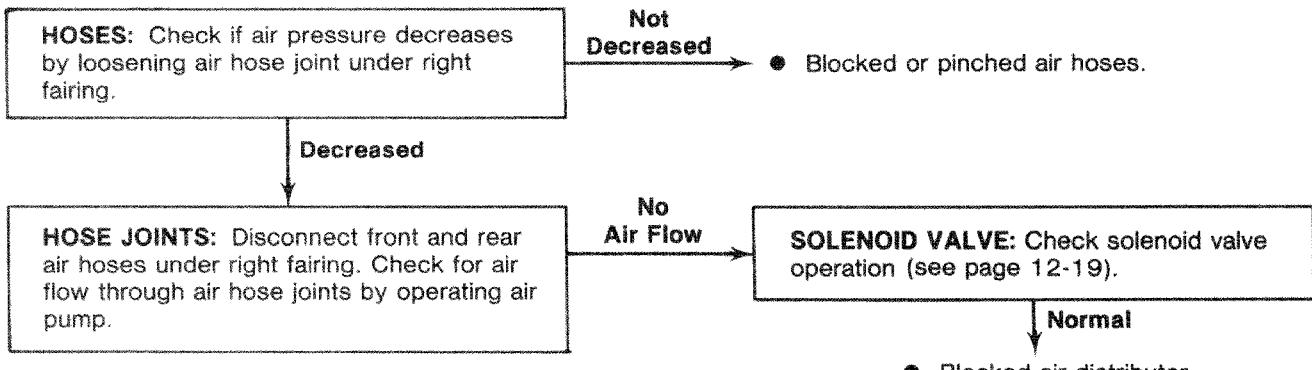

Auto Leveling Rear Suspension

Troubleshooting (cont'd)

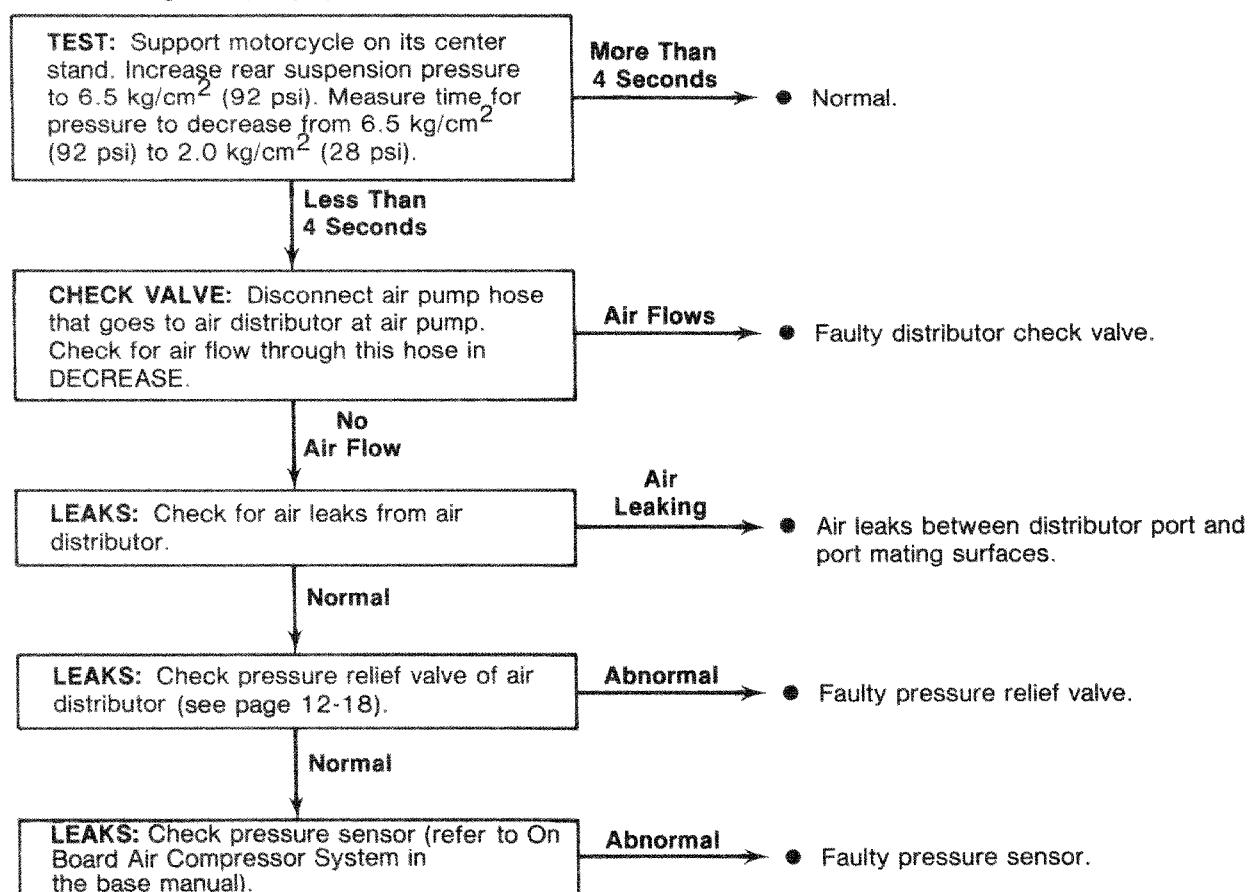

LCD shows decrease, but system doesn't respond.

Rapid pressure decrease, or loss after pressure check.

NOTE: When the suspension air pressure is at maximum, 1.0 kg/cm^2 (14 psi) front, and 6.5 kg/cm^2 (92 psi) rear, pushing the PRESSURE CHECK lever will reduce pressure to as low as 0.6 kg/cm^2 (9 psi) front, and 5.5 kg/cm^2 (78 psi) rear. This is normal operation.

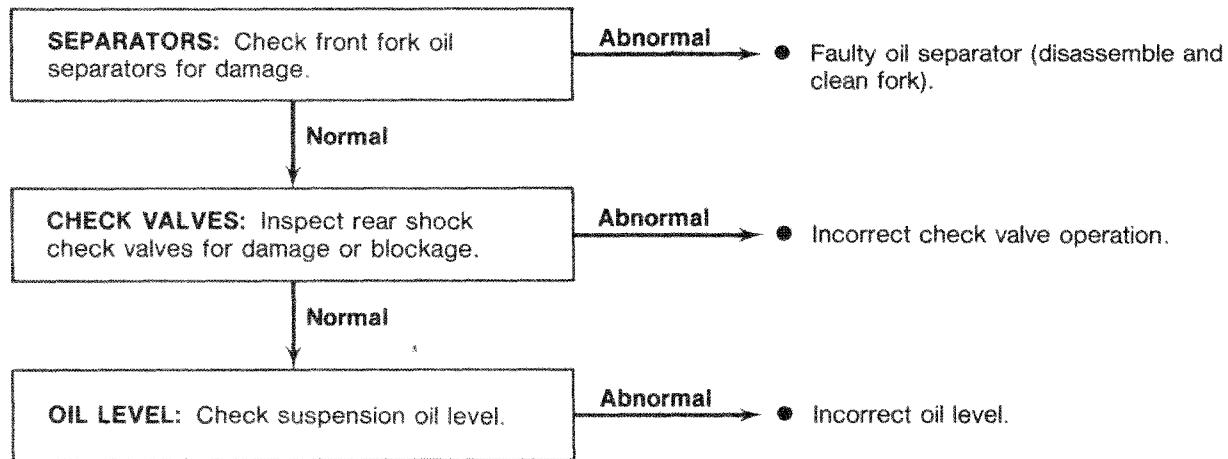

(cont'd)

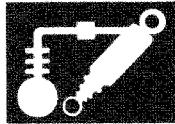

Auto Leveling Rear Suspension Troubleshooting (cont'd)

Oil leaks from air relief hose in DECREASE.

NOTES:

- Shock oil will leak into the air hoses if the shocks are laid down. Check rear shock absorber oil levels when there has been excessive oil leakage.
- Clean the air hoses and air distributor before inspecting the system.

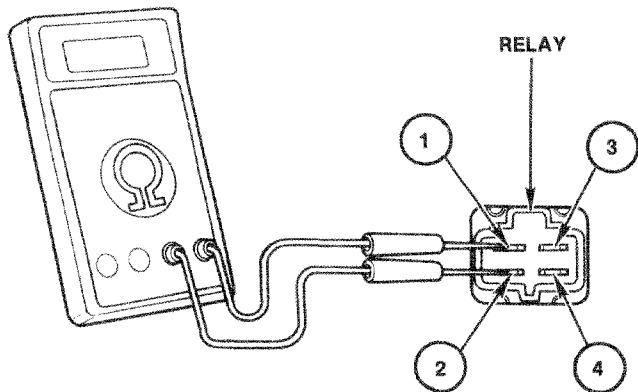

Air Pump Relay

Inspection

Remove the air pump relay (second from left) from the fuse/relay box.

Check for no continuity between terminals 1 and 2. If there is continuity, install a new relay.

Apply battery voltage across terminals 3 and 4 and check for continuity between terminals 1 and 2. If there is no continuity, install a new relay.

Suspension Control Switch

Inspection

Remove the right fairing pocket.

Disconnect the 20P coupler from the computer and check for continuity between the terminals indicated.

If tests indicate no continuity, check for a loose switch coupler or right fairing coupler, and for an open or short circuit in the wire harness or fairing sub harness.

Auto Leveling Rear Suspension Air Distributor

Removal

Remove the plugs from the three socket bolts.

Remove the bolts.

Disconnect the coupler to remove the display unit.

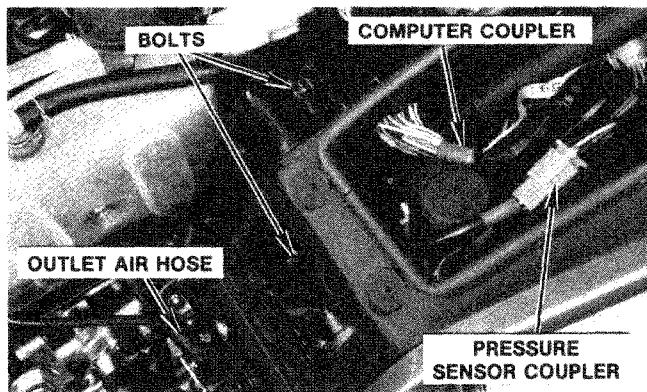

Remove the top compartment.

Remove the pressure sensor bracket mount bolts.

Disconnect the computer, pressure sensor, and solenoid valve couplers.

Disconnect the outlet air hose and fitting from the fairing panel.

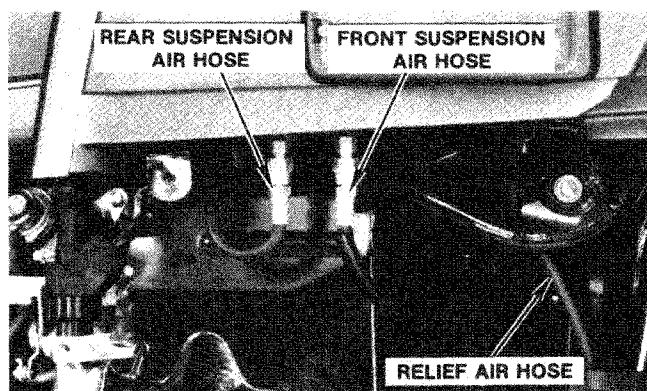

Remove the right fairing inner cover.

Disconnect the front and rear suspension air hoses from the air distributor.

NOTE: Use a wrench to keep the hose joint from turning while loosening the hose joint nut. Remove hoses slowly to allow pressure to bleed from air lines.

Free the air relief hose from the wire band.

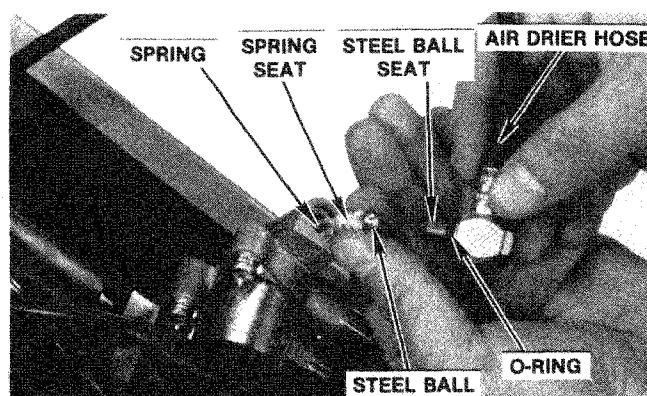

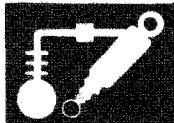

Lift the air distributor out of the fairing. Disconnect the air drier hose.

NOTE: The hose joint contains a steel ball, spring seat and spring. Be careful not to drop these. Inspect the O-ring and steel ball seat for damage or deterioration.

Remove the vent hose from the front of the air distributor.

Remove the air distributor.

Inspection (Solenoid Valve)

Reinstall the spring, spring seat, and steel ball in the hose joint. Connect the air hose to the air distributor.

Remove the pressure sensor from the air distributor. Attach a hand air pump to the front outlet joint and apply pressure.

If pressure does not remain steady, remove the solenoid valve and replace the rubber seat at the top of the rod.

While maintaining pressure, apply battery voltage between the Br/R (+) and G (-) terminals of the solenoid valve coupler.

If pressure is not relieved through the mounting hole of the pressure sensor, install new solenoid valve(s).

If pressure remains steady even when the solenoid valve is activated, clean the air passage in the air distributor.

Repeat the above procedure for the rear side applying battery voltage between the Br/Y (+) and G (-) terminals of the valve coupler.

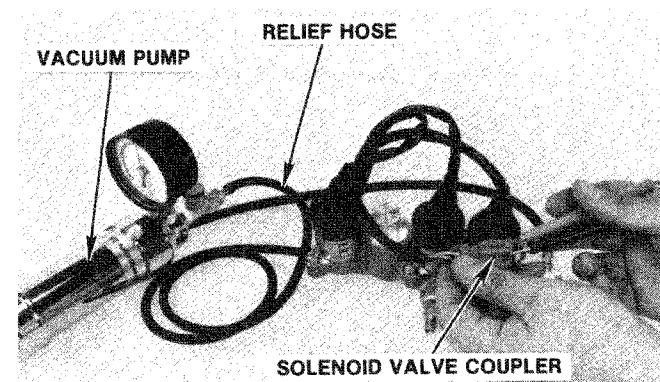

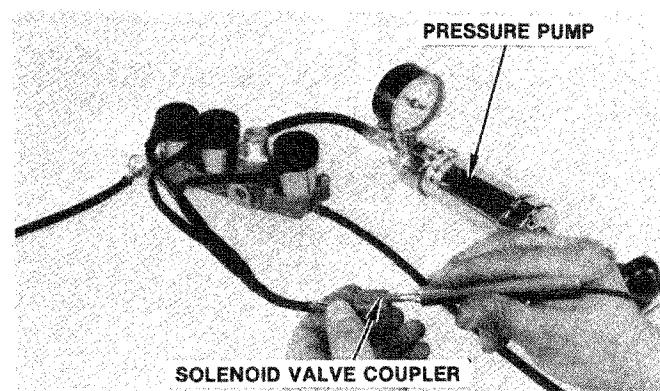

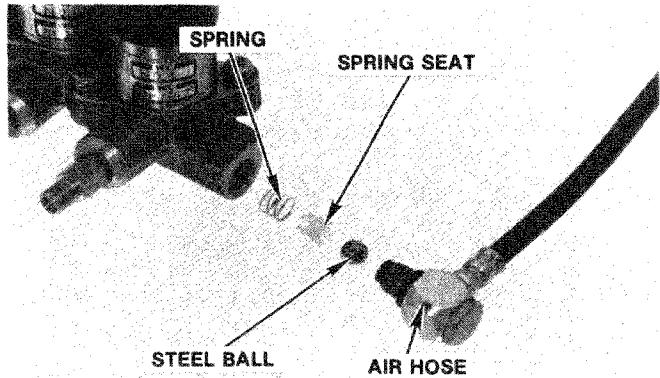

Apply vacuum to the air distributor relief port. If vacuum does not remain steady, remove the solenoid valve and replace the rubber seat at the top of the rod.

While maintaining vacuum, apply battery voltage between the Br/W (+) and G (-) terminals of the solenoid coupler. Vacuum should be relieved slowly.

If vacuum is relieved quickly, install a new air control needle in the relief port.

If the valves do not "click", install new ones.

If vacuum remains steady even when the solenoid valve is activated, clean the air distributor relief port.

(cont'd)

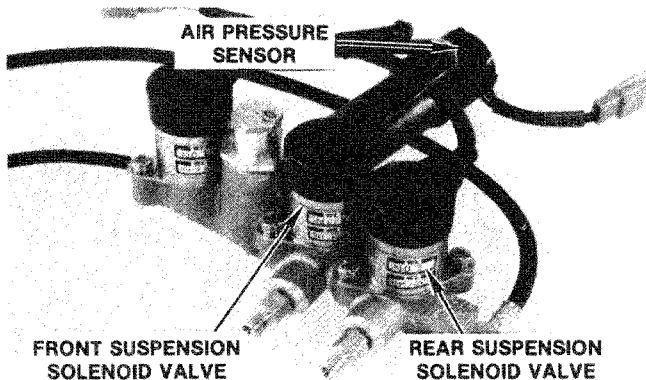

Auto Leveling Rear Suspension

Air Distributor (cont'd)

Disassembly

Remove the pressure sensor from the distributor.

Remove the front and rear suspension solenoid valves.

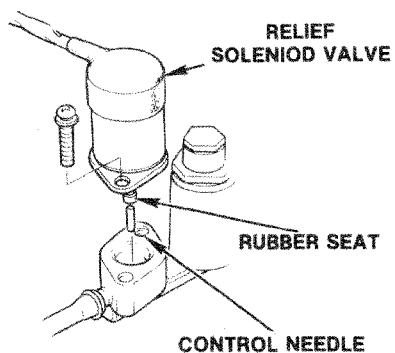

Remove the relief solenoid valve and air control needle.

NOTE: Remove the air control needle from the relief port so you do not lose it.

Check the rubber seat at the end of each valve rod.

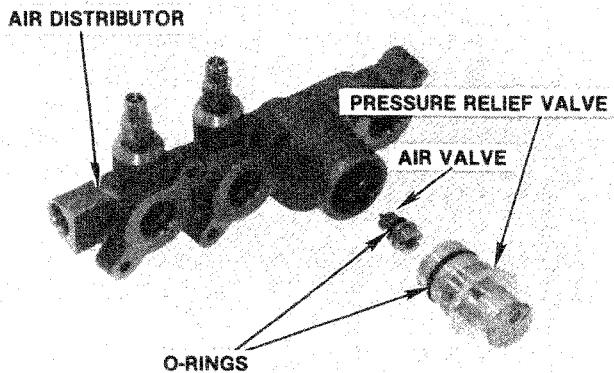

Replace damaged or deteriorated seats.

Remove the pressure relief valve and air valve.

Check the O-rings for damage or deterioration.

Check that the air valve moves freely.

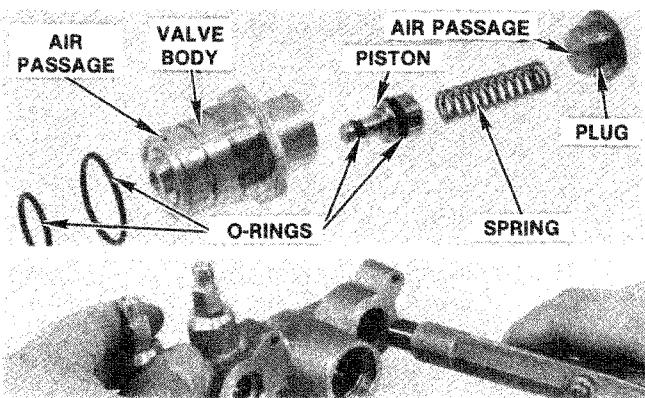

Disassemble the pressure relief valve.

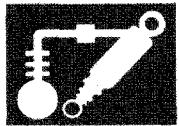

Check the O-rings for damage or deterioration.

Check the air passages for obstructions.

Blow open all passages in the valve.

Blow open all passages in the distributor.

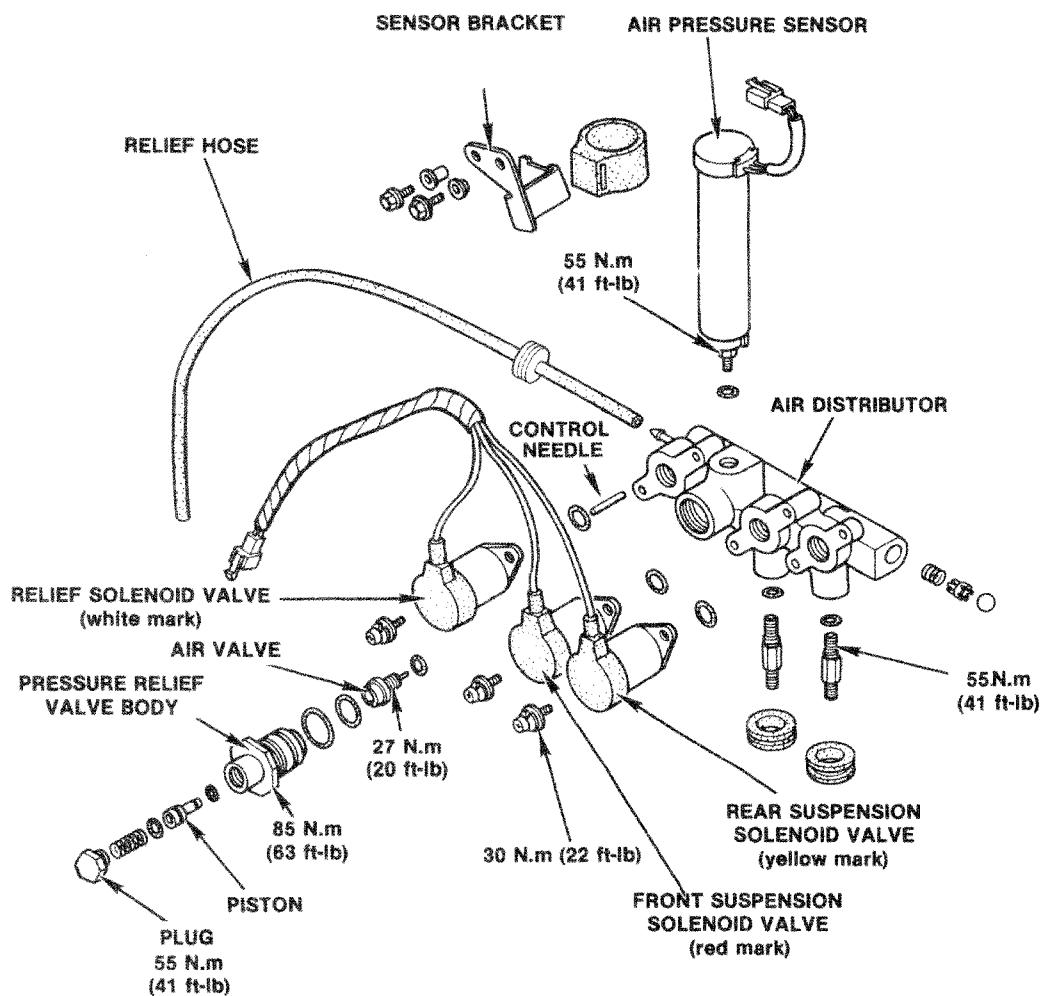

Assembly

Assemble in the reverse order of disassembly.

NOTES:

- Clean all parts before assembly.
- Apply a thin coat of clean engine oil or grease to all O-rings.
- Make sure the rubber solenoid valve seats are in place during assembly. Check each valve for proper seating.
- Torque the parts as indicated.

(cont'd)

Auto Leveling Rear Suspension

Air Distributor (cont'd)

Installation

Position the air distributor in the right fairing pocket with the relief hose facing forward.

Install the spring, spring seat, and steel ball into the air distributor hose joint. Apply clean engine oil or grease to the O-ring.

Position the air hose facing left and tighten the hose joint bolt.

Torque: 55 N.m (41 ft-lb)

Route the relief hose through the forward fairing hole.

Position the hose joints onto the fairing grommets. Use a chemical lubricant (CRC 5-56 or equivalent) to help position the hose joints.

Route the air relief hose.

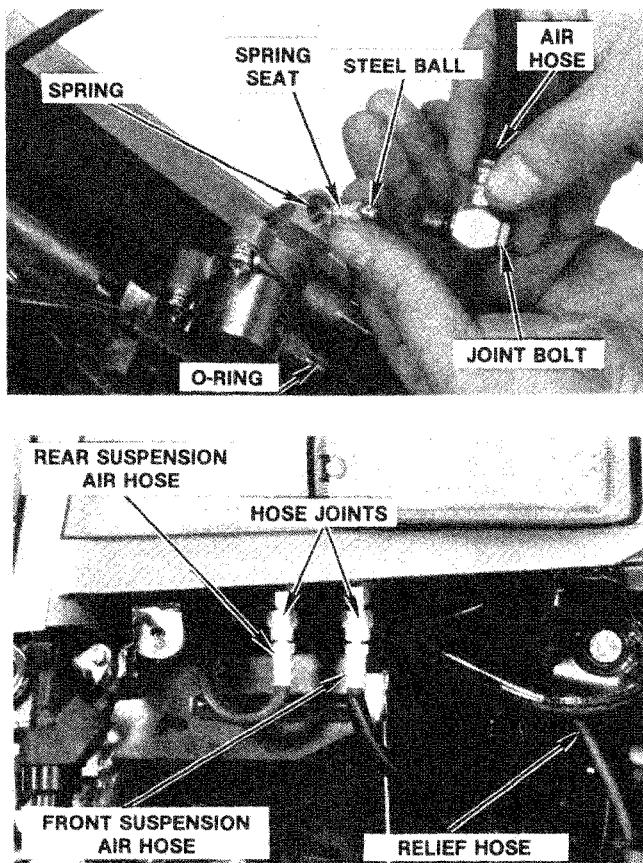

NOTE: Be careful not to pinch the air relief hose. If the hose is blocked or restricted, the RHC reacts as if the pressure sensor is faulty and shuts the system down.

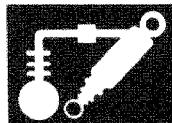

Connect the front and rear air hoses to the air distributor joints.

NOTE: Do not interchange front and rear air hose positions. Use a wrench to keep the hose joints from turning while tightening the hose coupler.

Tighten the hose joint nuts.

Torque: 12.5 N.m (9 ft-lb)

Pressure Relief Valve

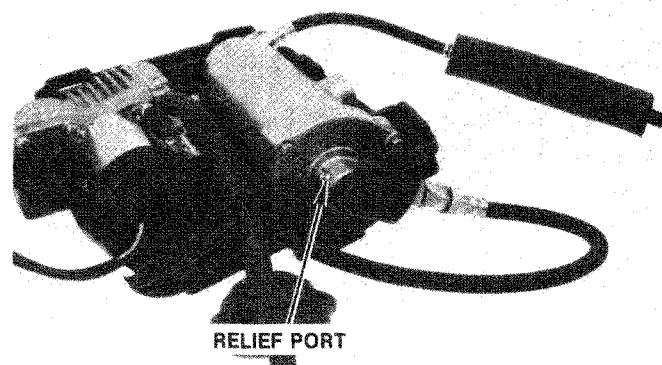

Removal/Inspection/Installation

Remove the air pump.

Remove the air pump cover.

Connect the air pump wire to the wiring harness.

Check that no air leaks past the the relief port during operation of the pump.

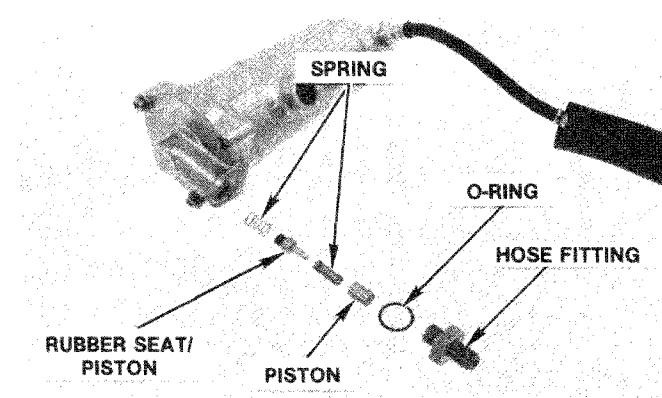

If air does leak, disassemble the relief valve and check the pistons, rubber seat and O-ring for wear or damage.

Install new parts as necessary.

Install the relief valve components.

Tighten the hose fitting.

Torque: 55 N.m (41 ft-lb)

Suspension Computer

Removal

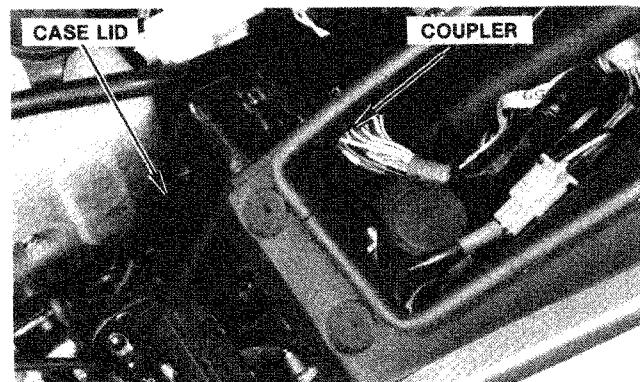

Remove the top compartment and right fairing pocket.

Disconnect the 20P black coupler.

Remove the two bolts and case lid.

Remove the computer from the case.

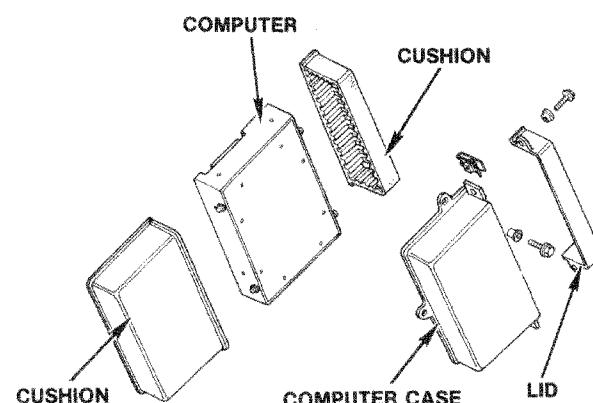

NOTE: To remove the computer case, the fairing must be removed.

Installation

Install in the reverse order of removal.

NOTE: Keep moisture, oil, and grease away from all computer parts.

Auto Leveling Rear Suspension Height Sensor

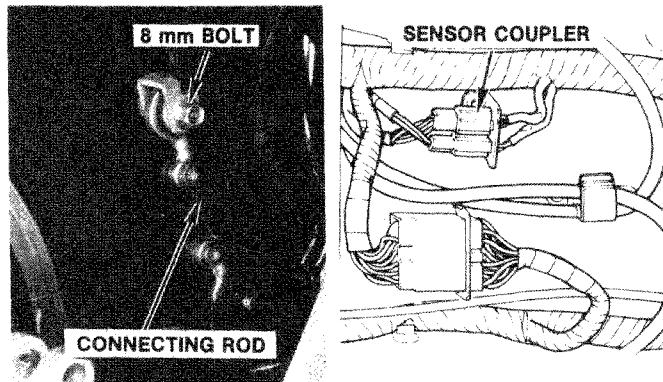

Removal

Support the motorcycle on its center stand.

Remove the 8 mm bolt to disconnect the sensor arm from the connecting rod.

Remove the seat.

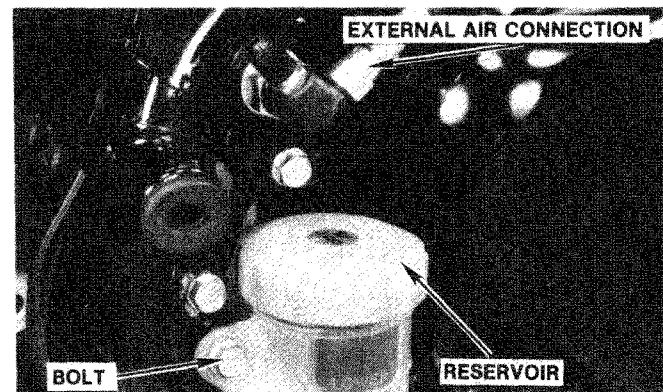

Disconnect the black 4P sensor coupler on the rear fender.

Remove the rear brake reservoir from the bracket.

Remove the external air connection.

Pull the arm through the rubber grommet and remove the sensor through the gap between the frame and fuel tank.

Inspection

Reconnect the sensor wire to the wiring harness.

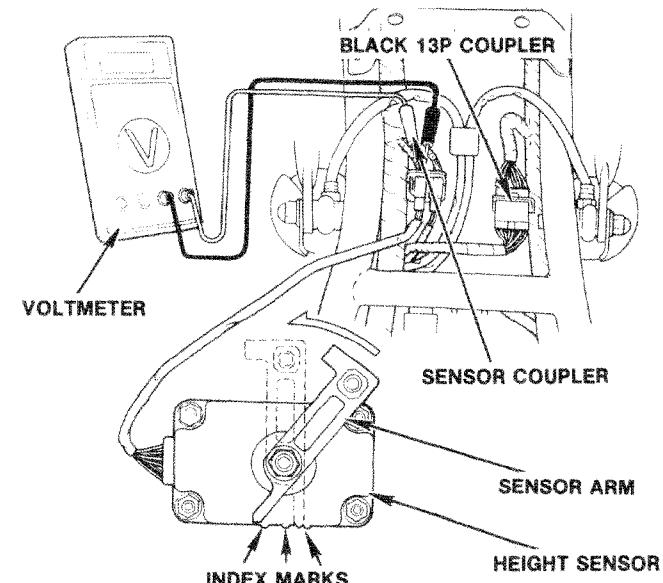

Measure the voltage between the Lg/R (+) and G/B (-) terminals of the sensor coupler with the ignition switch ON.

If there is no voltage, check the black 13P coupler on the rear fender for looseness.

If the coupler is OK, check the wire harness for an open circuit.

With the ignition switch ON, measure voltage between the sensor terminals in each of the three positions.

The voltage should be above 4V at the HI level, and below 1.2V at the LO level.

WIRE COLOR	VOLTAGE		
			HI
P/W(+) — G/B(-)	Lo		
P/Bu(+) — G/B(-)		Hi	
	Lo		Lo
SENSOR ARM POSITION	(1)	(2)	(3)

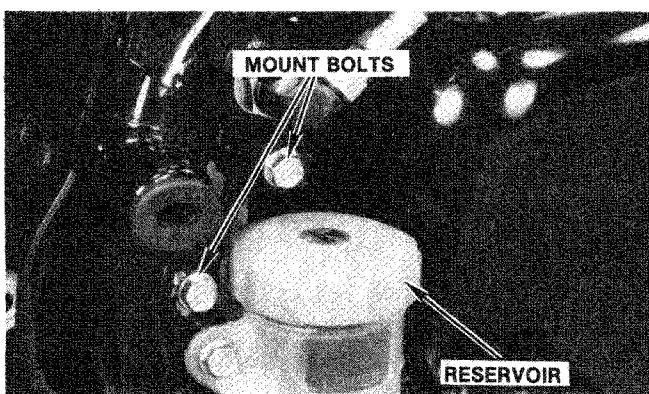

Installation

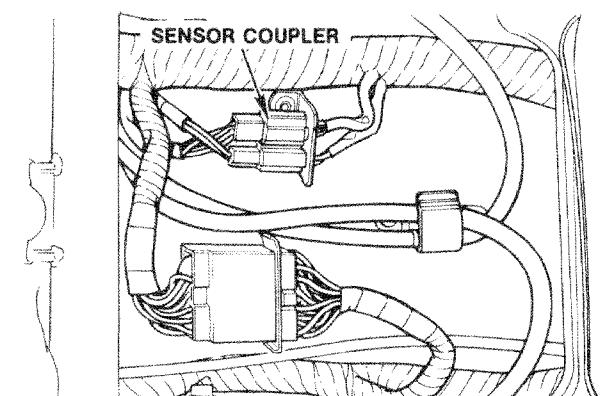

Position the sensor with the arm through the boot.

Insert the brake reservoir bolt through the frame and rotate the bracket into place.

Install the rear brake reservoir.

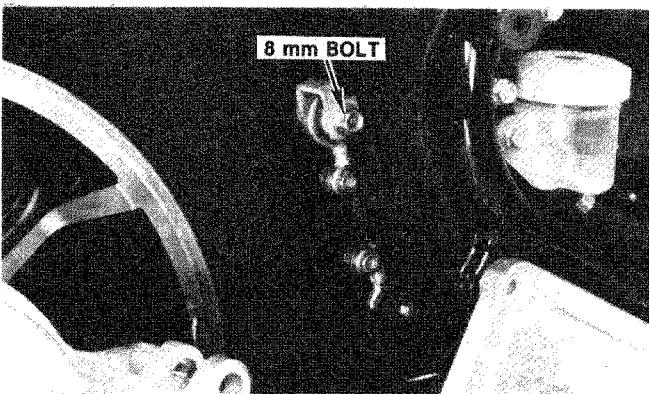

Route the sensor wire and connect the sensor coupler.

Connect the sensor arm to the connecting rod. Tighten the 8 mm bolt.

Torque: 21 N.m (15 ft-lb)

Adjustment

Support the motorcycle on its center stand.

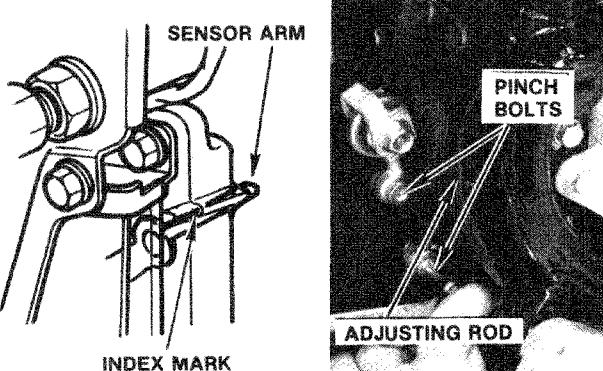

Loosen the adjusting rod pinch bolts.

Turn the adjusting rod to align the end of the sensor arm with the sensor case index mark.

Tighten the adjusting rod pinch bolts.

Torque: 12 N.m (9 ft-lb)

Install parts in the reverse order of removal.

System Wiring Diagram

Cruise Control Troubleshooting

Cruise control does not function at all.

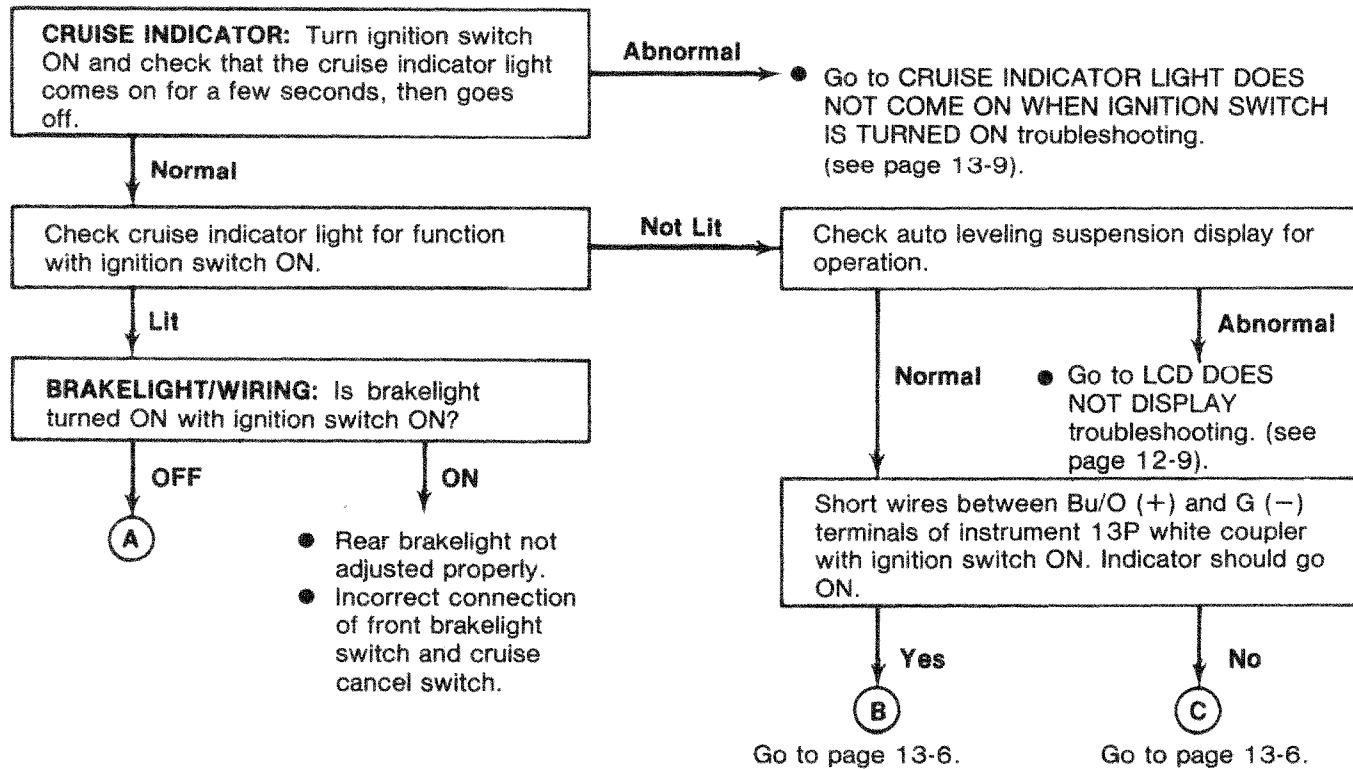

NOTES:

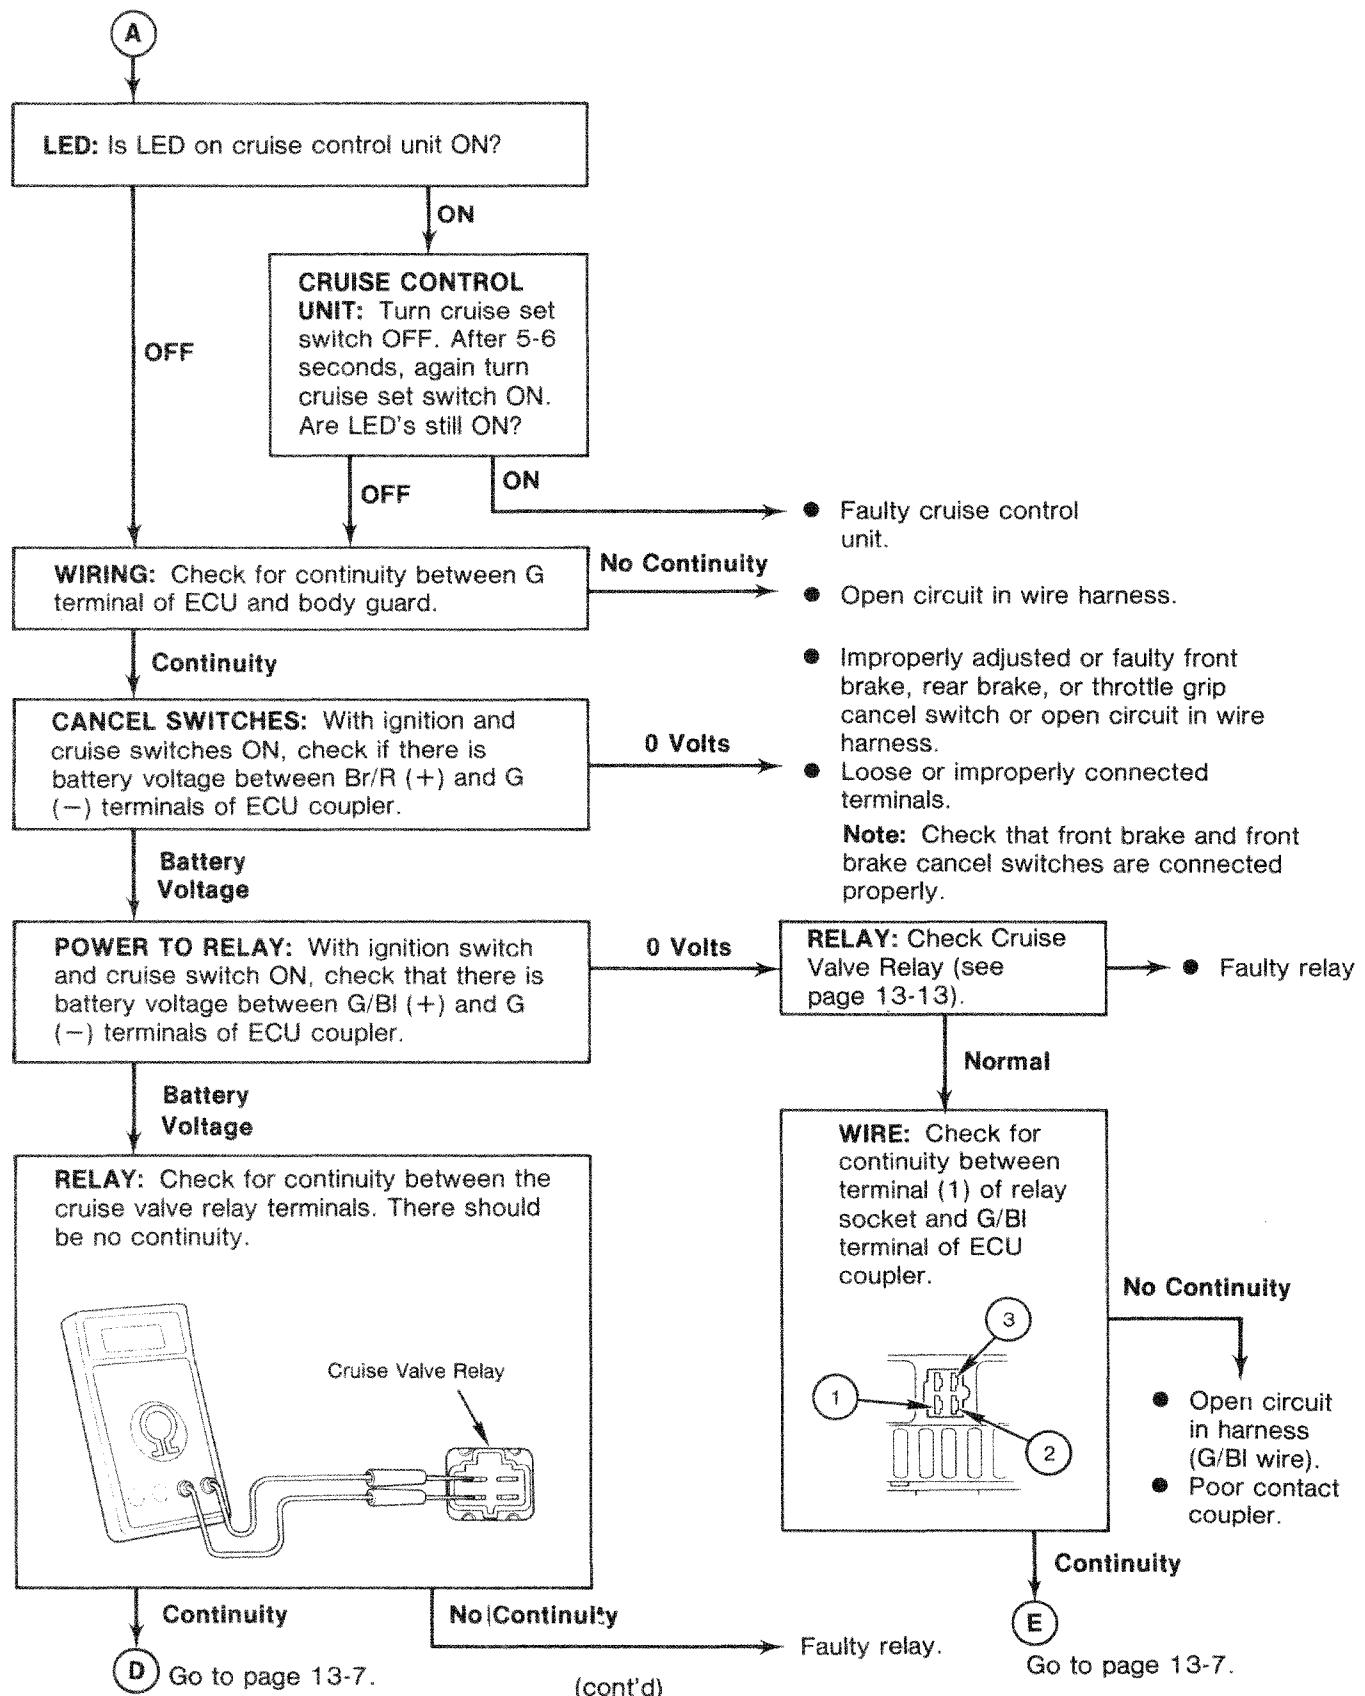

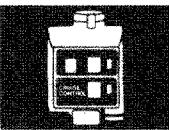

Cruise control will be cancelled when:

- Either brake is applied.
- Clutch lever is operated.
- Transmission is shifted.
- Two or more switches are operated simultaneously.
- Throttle is returned.
- Ignition switch, engine stop switch or cruise switch is operated.

Cruise control will not function under the following conditions.

- At speeds other than 30-80 mph.
- Transmission set in other than 4th or OD.

goldwingdocs.com

Cruise Control

Troubleshooting (cont'd)

From page 13-4.

B

Yes

From page 13-4.

C

WIRING: Check Bu/O wire for continuity between instrument 13P coupler and ECU coupler.

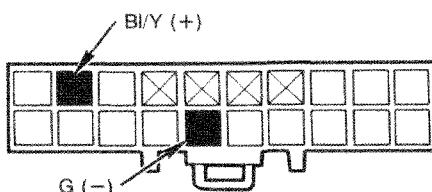

Continuity

- Blown lamp.
- Open circuit in meter.
- Open circuit of W wire in right fairing pocket.

No Continuity

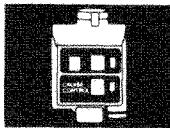

- Open circuit.
- Poorly connected 13P white coupler of right fairing coupler.

Is there battery voltage between BI/Y (+) and G (-) terminals of control unit coupler with ignition and cruise control switches ON.

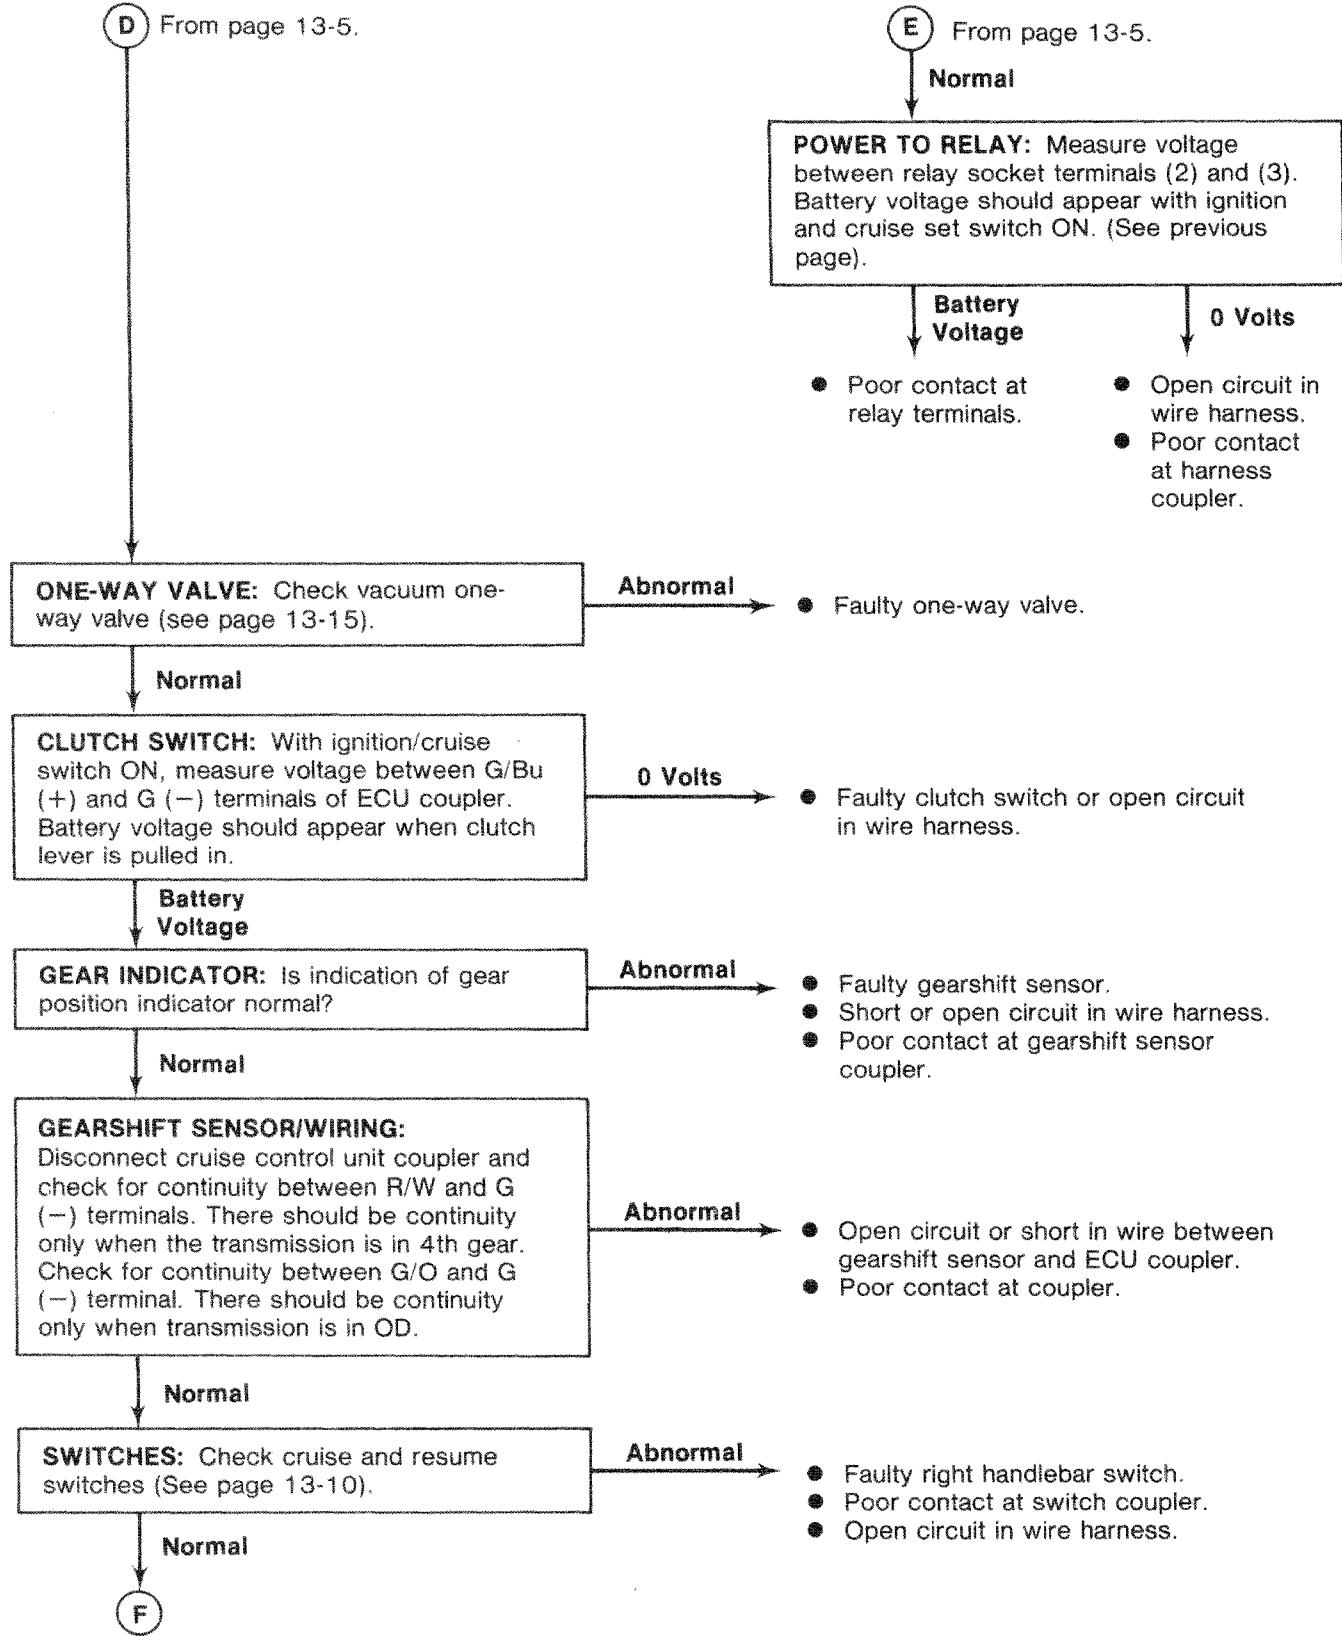

0 Volts

- Faulty cruise set switch.
- Open circuit in harness or poor contact at coupler.

D From page 13-5.

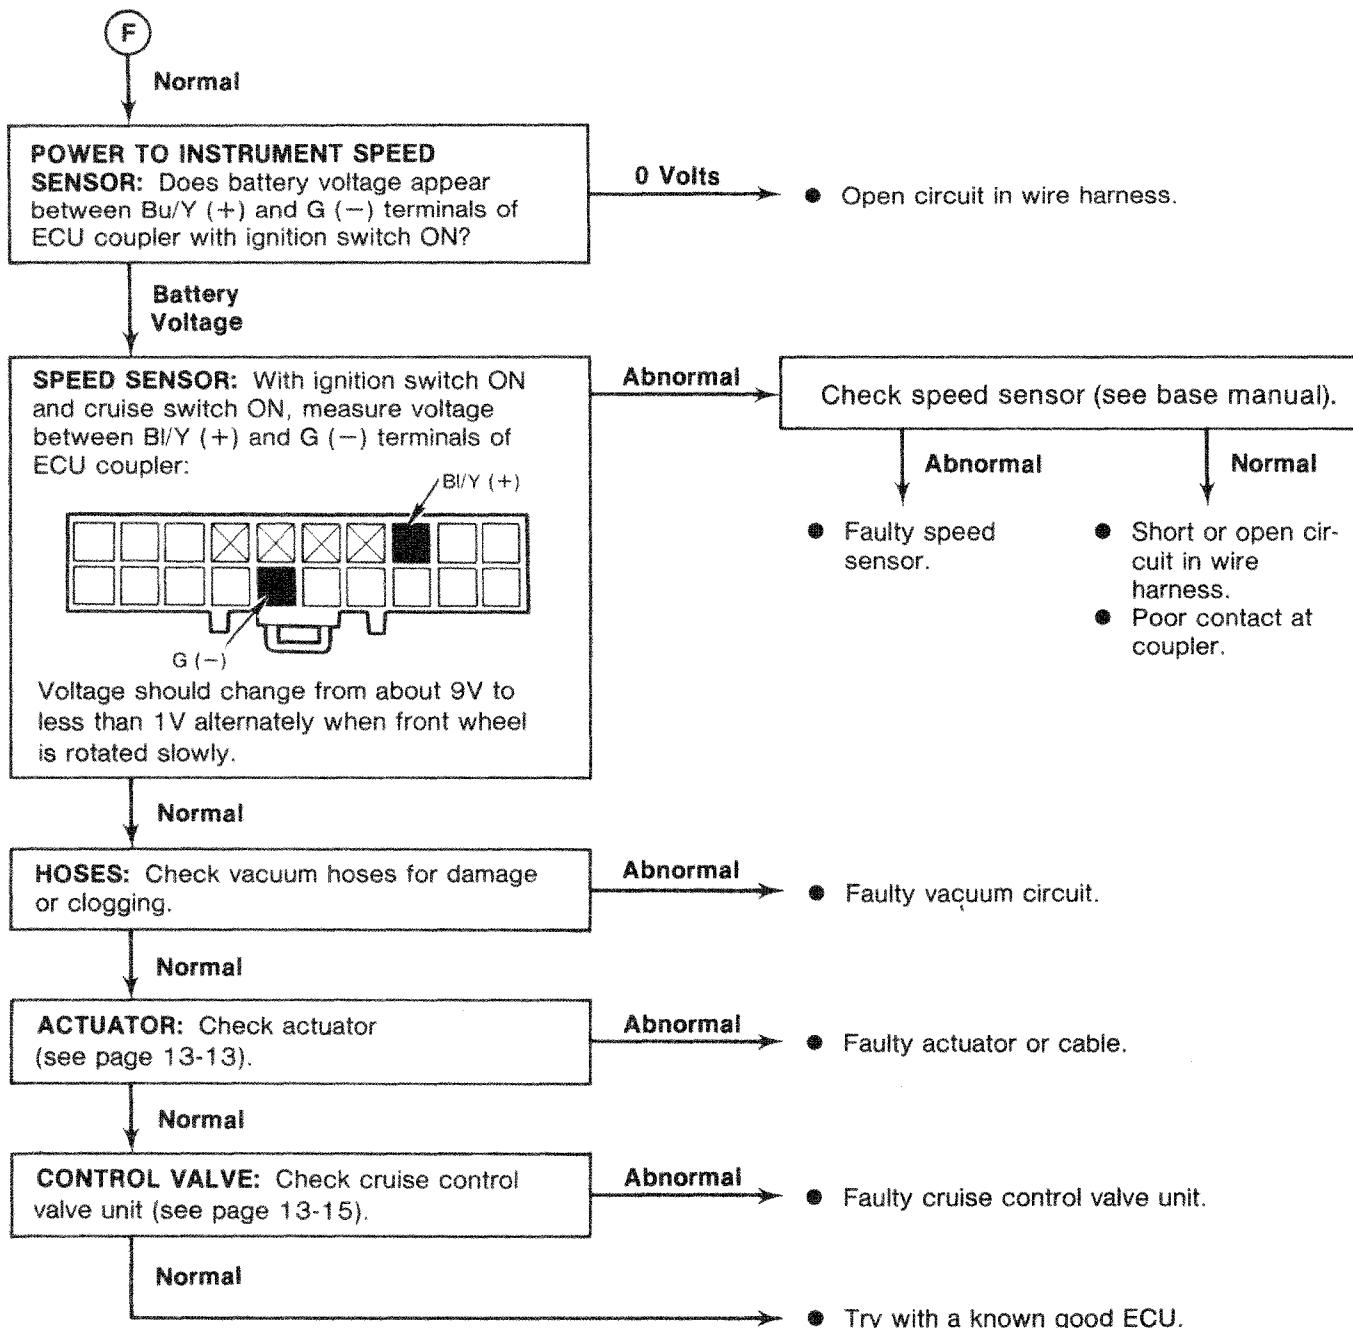

E From page 13-5.

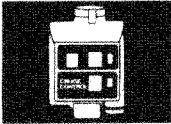

(cont'd)

Cruise Control

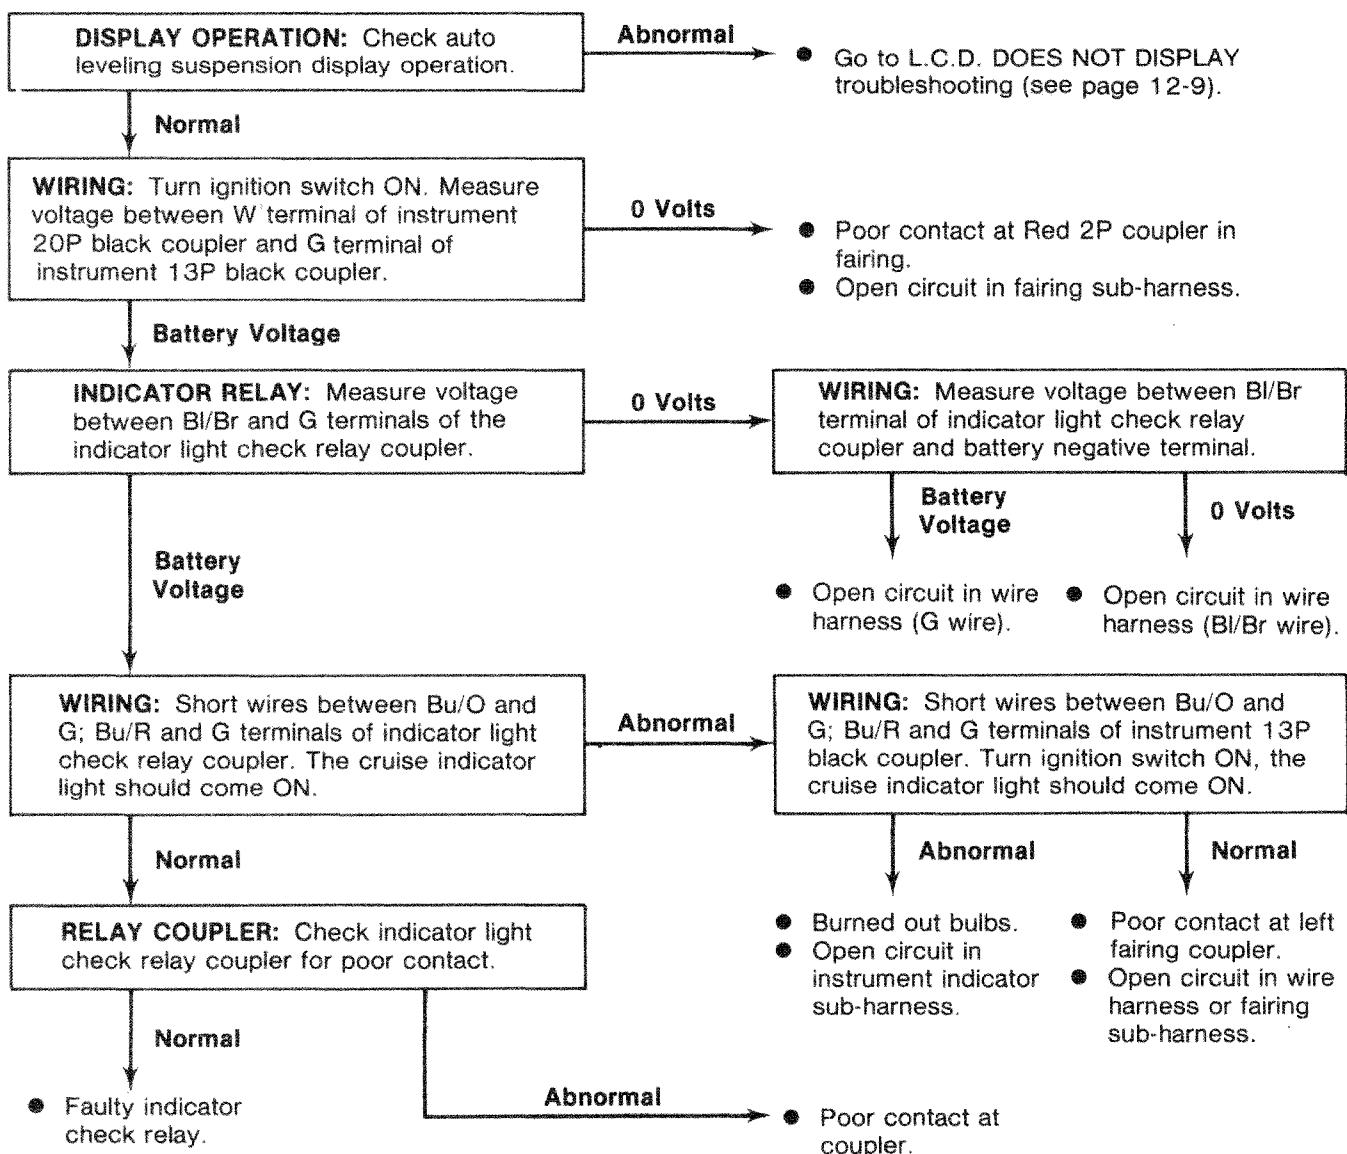

Troubleshooting (cont'd)

Cruise Indicator Light Does Not Come On When Ignition Switch Is Turned On.

NOTE: Check indicator bulbs if either cruise "set" or cruise "on" indicator does not come on.

(cont'd)

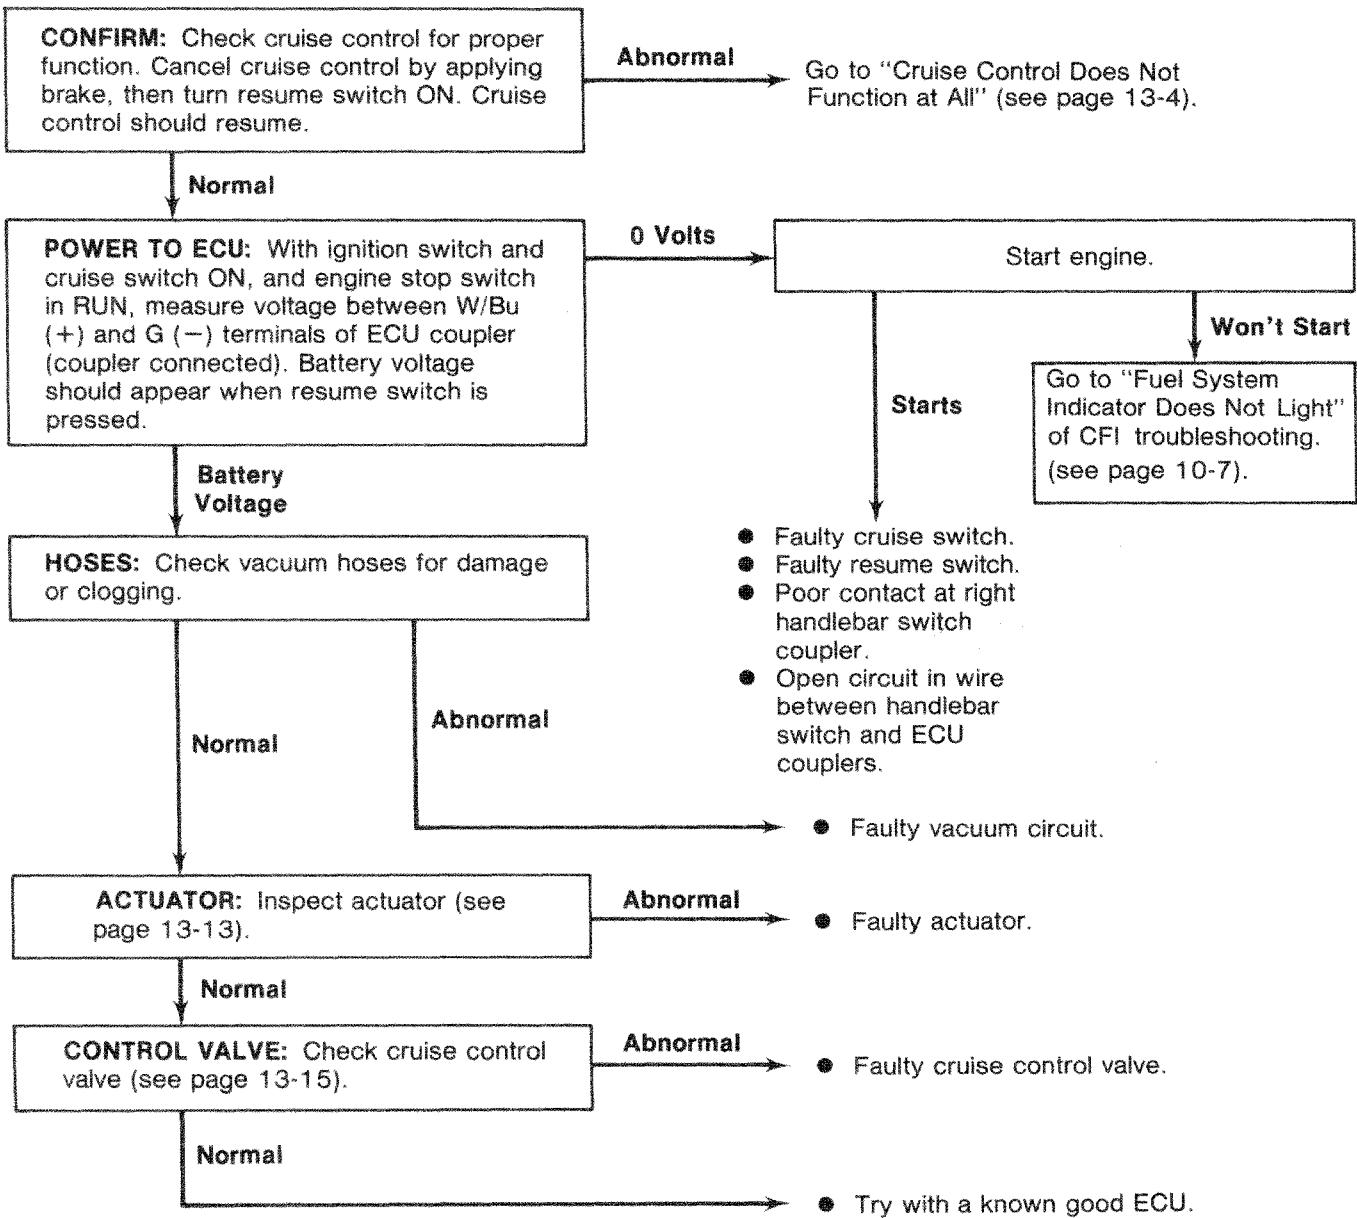

Cruise Control

Troubleshooting (cont'd)

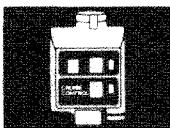

Cruise Control Will Not Resume

NOTES:

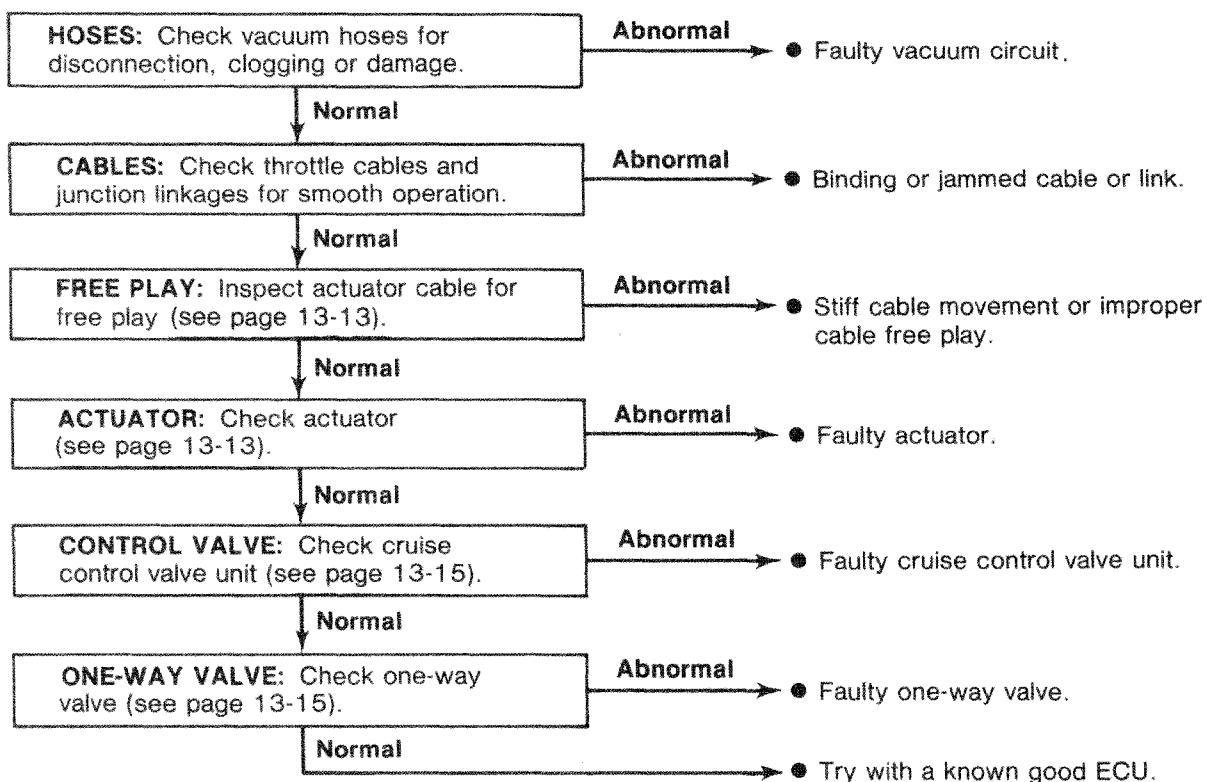

- Cruise control will not resume below 30 mph.
- Holding resume/acc switch ON causes the motorcycle to accelerate to nearly full throttle. However, cruise control will only operate to 80 mph.
- Cruise control is not resumed when either the cruise set switch, engine stop switch or ignition switch is turned OFF, or when both the resume and set switch are operated simultaneously (memory is erased).

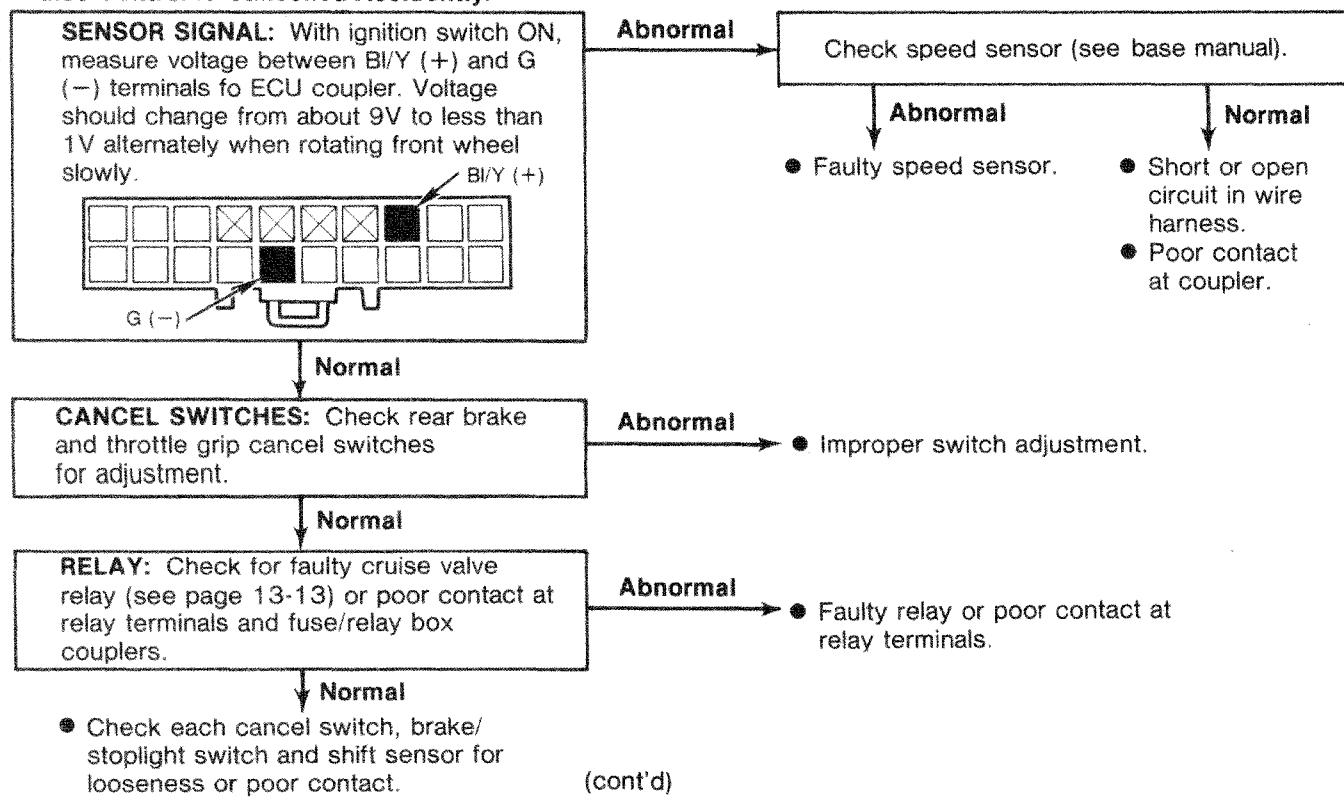

goldwingdocs.com

Cruise Speed Fluctuates Excessively (More Than 5 mph) Immediately After Setting

Cruise Control is Cancelled Accidentally.

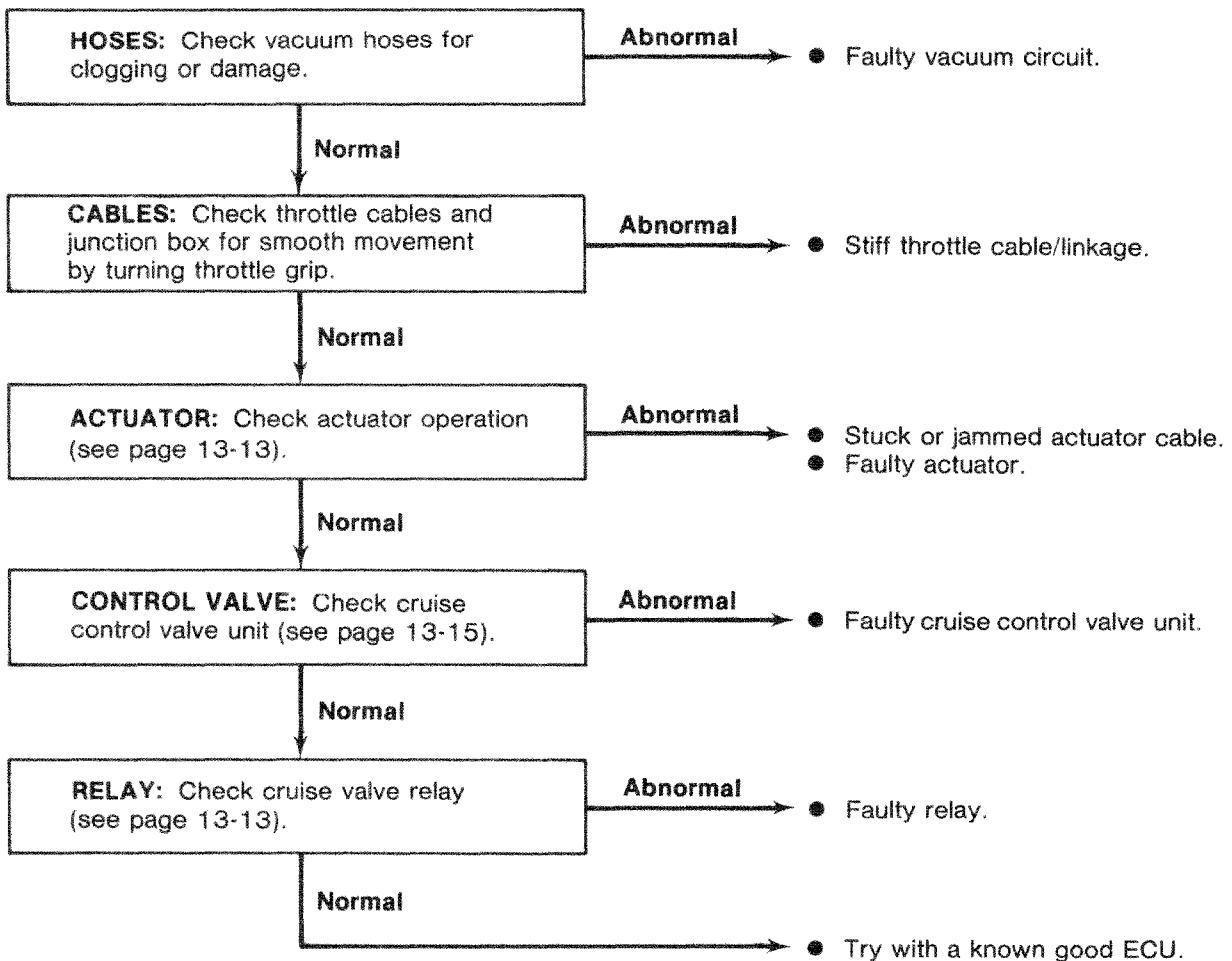

Cruise Control

Troubleshooting (cont'd)

Cruise Control Cannot be Cancelled.

Note: The cruise control should cancel when brake is applied, clutch lever is operated, throttle grip is returned, or transmission is shifted. Before going into details, check the cancel switch, brake/stoplight switch or sensor for proper operation.

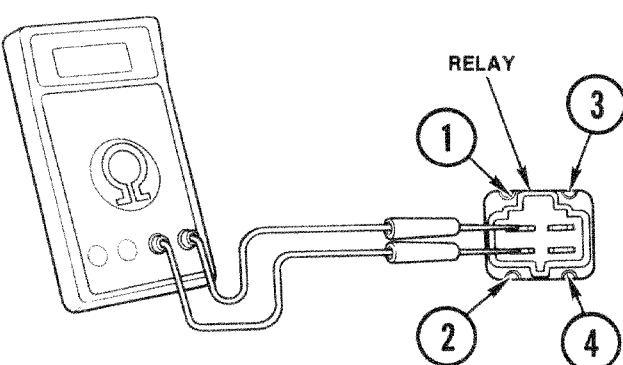

Cruise Valve Relay

Inspection

Remove the cruise valve relay from the fuse/relay box.
(Third relay from the left.)

Check for no continuity between terminals #1 and #2. If there is continuity, install a new relay.

Apply battery voltage across terminals #3 and #4 and check for continuity between terminals #1 and #2. If there is no continuity, install a new relay.

Cruise Actuator

Inspection

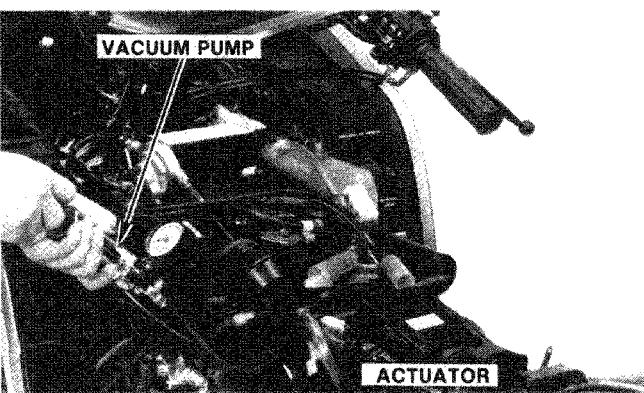

Remove the top compartment.

Disconnect the vacuum hose from the actuator, and connect a vacuum pump to the actuator. Apply vacuum.

If vacuum does not remain steady, install a new actuator.

If the throttle grip does not rotate with vacuum applied, check the following:

- Throttle Operation
- Junction box (operation of drum and lever)
- Actuator cable
- Throttle cables

(cont'd)

Cruise Control

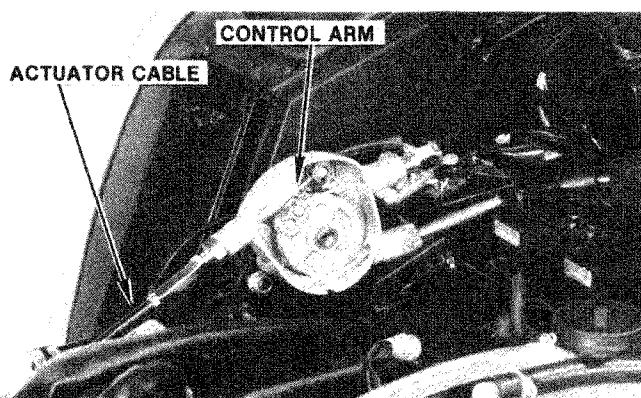

Cruise Actuator (cont'd)

Removal

Remove the cover from the junction box and disconnect the end of the actuator cable from the control arm.

Remove the two nuts. Remove the actuator from the bracket. Loosen the cable joint nut and disconnect the cable from the junction box.

Pull the vacuum hose off the actuator. (Be careful not to puncture the hose.)

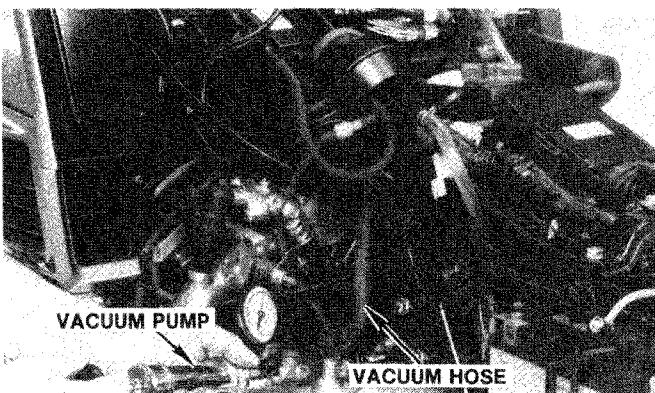

Vacuum Hose

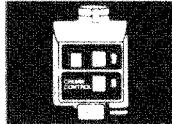

Inspection

Disconnect the vacuum hose from the intake pipe of the No. 4 cylinder.

Connect a vacuum pump to the hose and apply vacuum.

If vacuum does not remain steady, check the vacuum hose for damage, deterioration or loose connection.

One-Way Valve

Inspection

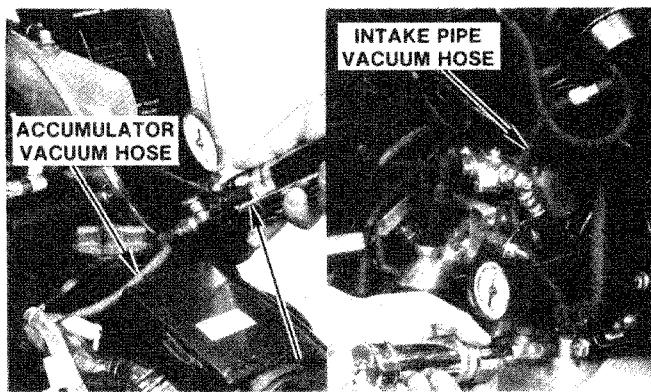

Disconnect the vacuum hose from the accumulator. Connect a hand air pump to the vacuum hose and apply air pressure.

Pressure should not remain.

Disconnect the vacuum hose from the intake pipe of the no. 4 cylinder. Connect a hand air pump to the vacuum hose and apply air pressure.

Pressure should remain steady.

If unable to obtain the above results, install a new one-way valve.

Cruise Control Valve

Inspection

Remove the cruise control valve from its bracket. Disconnect the valve coupler. Pry off the intake pipe and actuator vacuum hoses with a small screwdriver.

CAUTION: The plastic connectors are fragile. Pull the hoses straight off; side stress may break the connectors.

Connect a vacuum pump to the intake pipe vacuum hose and apply vacuum. If the vacuum does not remain steady, install a new valve.

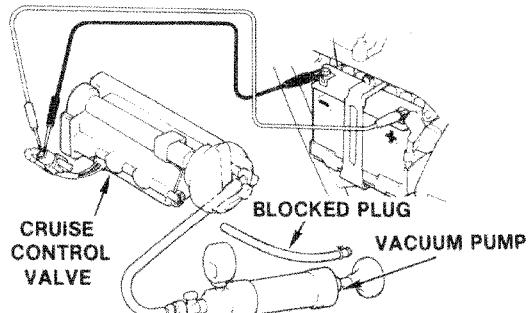

While maintaining vacuum, apply battery voltage across the coupler terminals shown in the table on the right.

Test each pair of terminals (wires) with the actuator hose port open and then blocked with a plugged hose.

CAUTION: Avoid touching the positive (+) battery test wire to the negative (-) test wire. If a test involves two or more negative wires, first connect all negative wires to the negative battery wire, then connect the positive wire to the positive battery wire.

If unable to obtain specified results, install a new valve.

(cont'd)

NOTES:

HOLD: Vacuum should remain steady when battery voltage is applied to the terminals.

RELIEVE: Vacuum should be relieved when battery voltage is applied.

DECREASE: About 100-150 mmHg of vacuum will be lost each time battery voltage is applied.

Battery Voltage	Vacuum		
(-) battery wire	(+) battery wire	Blocked tube connected (Port closed)	Blocked tube not connected (Port open)
Current not applied		HOLD	HOLD
Br/Bl	Br/W	RELIEVE	RELIEVE
G	Br/W	HOLD	HOLD
Br	Br/W	HOLD	HOLD
Br/Bl, G	Br/W	RELIEVE	RELIEVE
Br/Bl, Br	Br/W	RELIEVE	RELIEVE
Br, G	Br/W	HOLD	HOLD
Br/Bl, Br, G	Br/W	DECREASE	RELIEVE

Cruise Control

Cruise Control Valve (cont'd) —

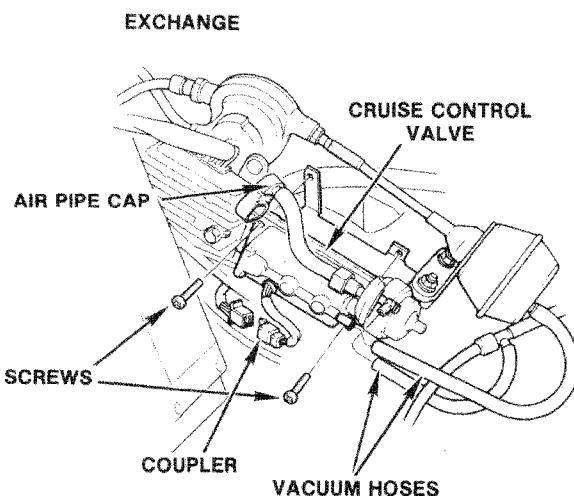

Remove the two screws to release the valve.

Disconnect the coupler.

Remove the air pipe cap from the valve.

Disconnect the vacuum hoses from the valve.

CAUTION: The plastic connectors are fragile. Pull the hoses straight off; side stress may break the connectors.

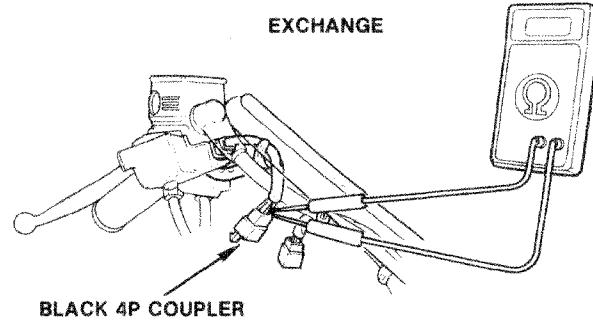

Cruise Cancel Switches —

Front Brake

Disconnect the black 4P coupler behind the right handlebar.

Check for continuity between the BI/Bu and G/W wire terminals.

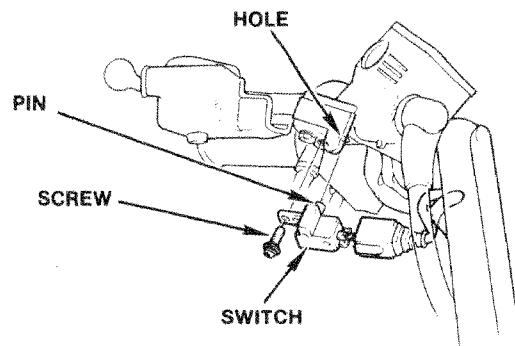

Brake lever released: Continuity
Brake lever pulled in: No continuity

If unable to obtain the above results, check for continuity at the switch terminal. If switch continuity is normal, check the sub-harness for continuity. If continuity is abnormal, install a new switch.

Remove the screw and disconnect the wires from the switch.

NOTE: When installing the switch, align the switch pin with the master cylinder hole. Connect the wires to the correct size terminals.

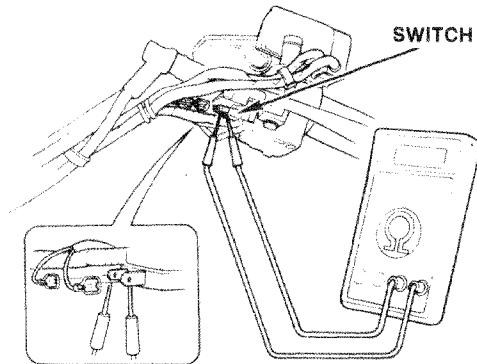

Clutch

Disconnect the BI/Y and G/Bu wires from the terminals on the cruise cancel switch.

Check for continuity between the switch terminals.

Clutch lever released: No continuity
Clutch lever pulled in: Continuity

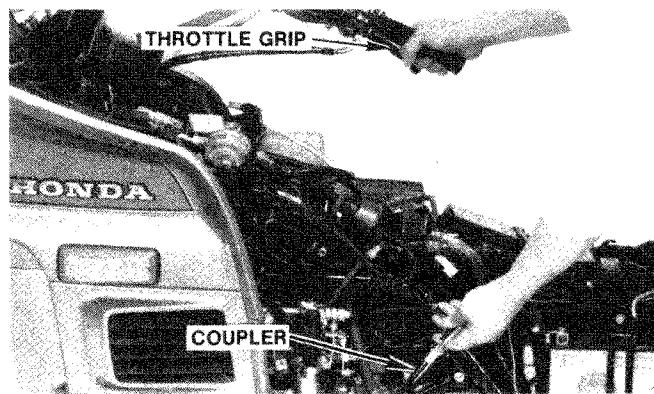

Throttle

Disconnect the throttle cancel switch coupler from the wire harness.

Check for continuity at the 2P coupler just left of the cruise control unit.

Throttle closed: Continuity
Further return: No continuity

To adjust, remove the fuel strainer from the left engine mount bracket.

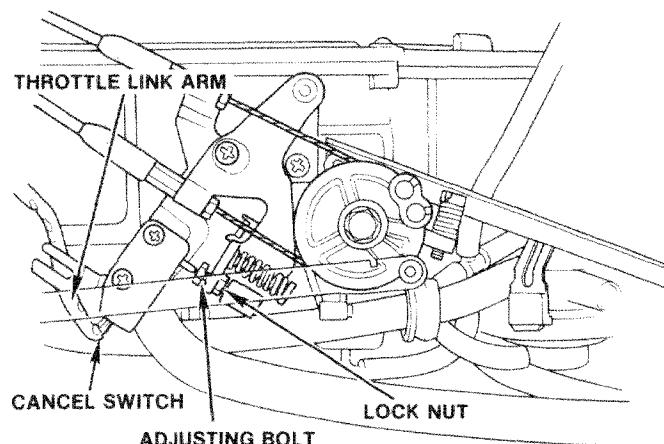

Disconnect the left throttle link arm from the throttle arm.

Loosen the adjusting bolt lock nut.

Connect an ohmmeter to the switch wires and turn the adjusting bolt until "continuity" shifts to "no continuity".

Back off the adjusting bolt 2-1/3 rotations and tighten the lock nut.

NOTE: Replace the switch if continuity or no continuity fails to shift.

(cont'd)

Cruise Control

Cruise Cancel Switches (cont'd)

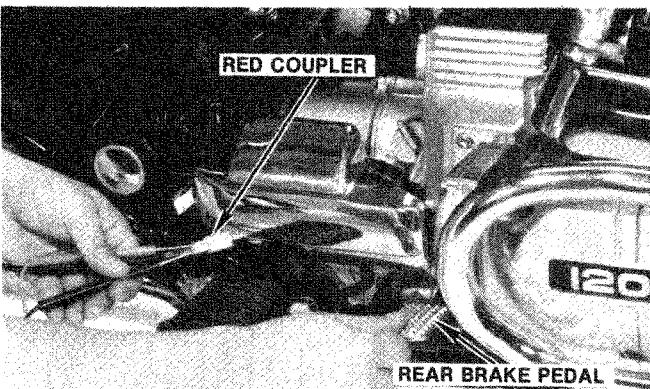

Rear Brake

Disconnect the rear brake cancel switch coupler.

Check for continuity between the wires sheltered on the right side just below the cruise vacuum accumulator.

Brake pedal released: continuity

Brake pedal depressed: No continuity

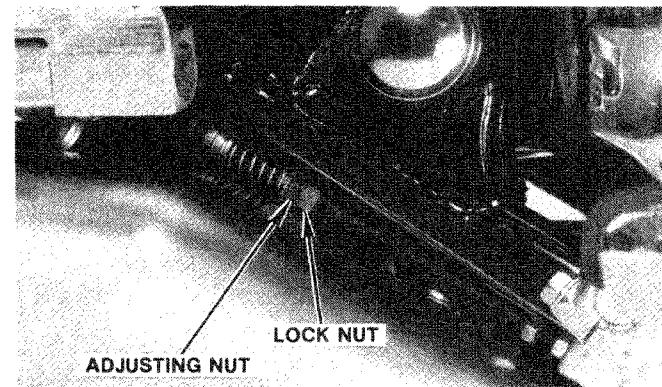

To adjust, remove the exhaust pipe and muffler.

Loosen the lock nut on the master cylinder push rod.

Connect an ohmmeter to the switch wires and turn the adjusting nut until "continuity" shifts to "no continuity".

Back the adjusting nut off 1/2 turn (toward the brake pedal) and tighten the lock nut.

NOTE: Replace the switch if continuity or no continuity fails to shift.

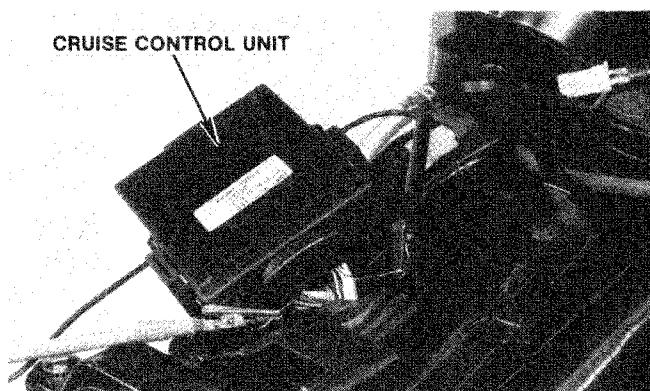

Cruise Control Switches

Cruise Switch

Remove the cruise control unit dust cover. Measure voltage between the BI/Y(+) and G(−) terminals of the coupler.

NOTE: Do not confuse this wire with the BI/Y speed sensor wire.

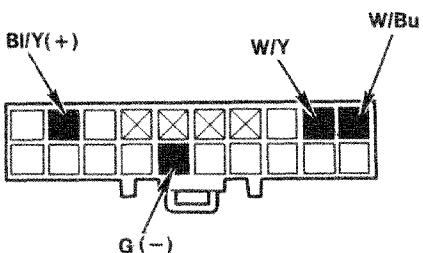

The switch is normal if battery voltage is present with the cruise control and ignition switches ON.

Set Switch

Measure voltage between the W/Y(+) and G(−) terminals of the cruise control coupler.

The switch is normal if battery voltage is present with the set switch flipped down and the ignition switch ON.

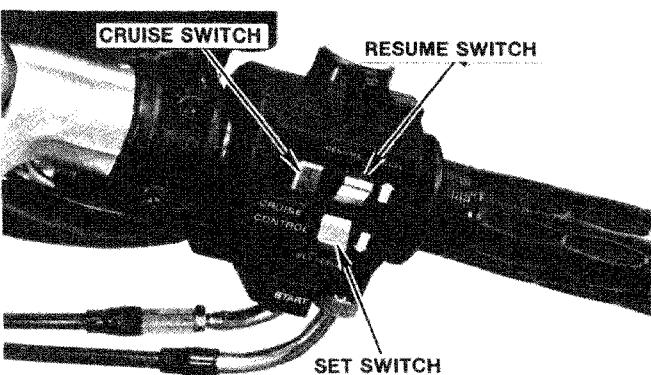

Resume Switch

Measure voltage between the W/Y(+) and G(−) terminals of the cruise control coupler.

The switch is normal if battery voltage is present with the resume switch flipped up, and the cruise and ignition switches ON.

To further test the resume switch, check for continuity between the terminals of the handlebar switch coupler.

Remove the coupler holder from the fairing and disconnect the brown 6P right handlebar switch coupler. Check for continuity between the terminals.

Junction Box

Removal/Disassembly

Remove the cover from the junction box.

Remove the actuator cable and loosen the throttle cable lock nuts.

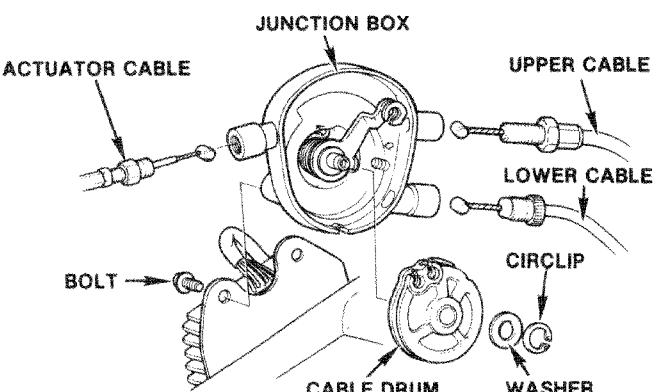

Remove the mount bolts and junction box from its bracket.

Remove the circlip and washer.

Remove the cable drum from the cable ends.

Disconnect the lower throttle cable first, then the upper throttle cable.

Remove the control arm and return spring from the junction box.

(cont'd)

Cruise Control

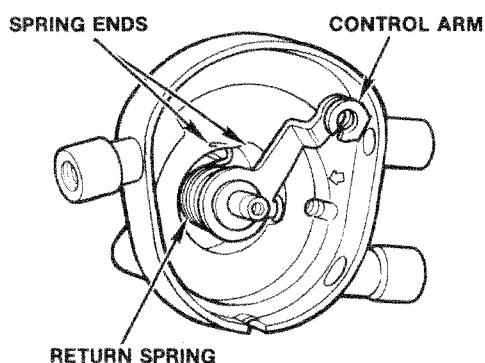

Junction Box (cont'd)

Assembly/Installation

CAUTION: Keep contaminants away from junction box sliding surfaces. Clean parts with solvent before assembly.

Coat the sliding faces of the control arm and shaft with grease.

Hook the ends of the return spring against the case and arm securely with the control arm in the six o'clock position. Rotate the control arm counterclockwise to the twelve o'clock position and push it back into the junction box assembly.

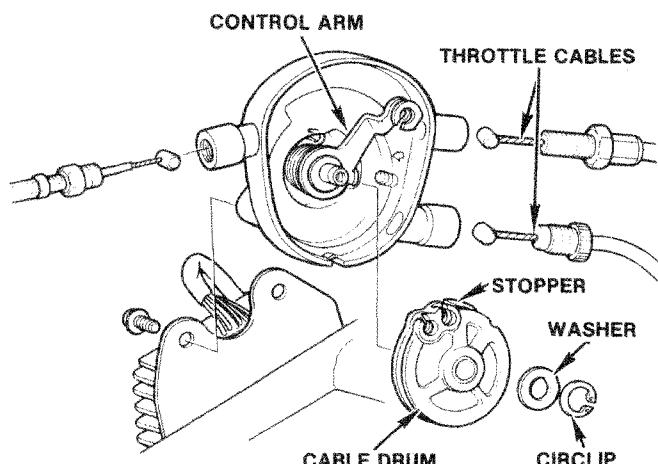

Connect the throttle cables to the junction box. Coat the sliding faces of the cable drum and drum shaft with grease.

Insert the ends of the throttle cables into the slots in the cable drum. Install the cable drum in the case.

NOTE: Install the cable drum with the stopper facing the inside. Connect the cables to the cable drum with the stopper contacting the control arm.

Install the washer and a new circlip on the drum shaft. Install the circlip with the sharp edge facing out. Be sure the circlip is seated all the way around the circlip groove.

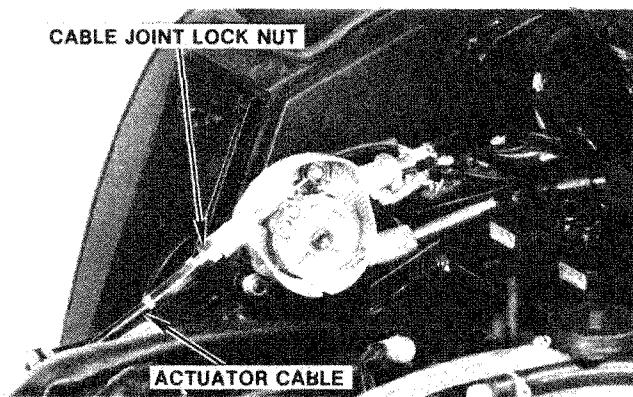

Grease the end of the actuator cable and connect the cable end to the control arm.

Tighten the cable joint lock nut.

Recheck the throttle grip operation.

Install the junction box on the bracket.

Adjust the throttle cables (see page 13-22).

Throttle Operation

Check for smooth throttle grip full opening and automatic full closing in all steering positions.

Make sure there is no deterioration, damage, or kinking in the throttle cables. Replace any damaged parts.

If throttle operation is not smooth, check the inner cable condition. Replace them if they are frayed or kinked.

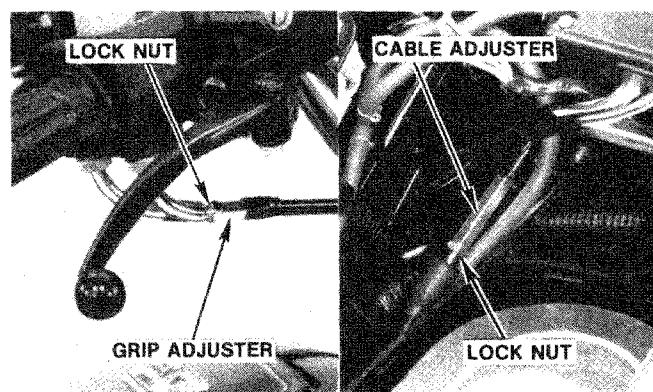

Make sure throttle grip free play is 2-6 mm (1/8-1/4 in) at the throttle grip flange.

Make minor adjustments with the throttle grip adjuster.

Make major throttle grip free play adjustments with the middle cable adjuster after removing the top compartment.

To adjust, loosen the lock nut, turn the adjuster as required, and tighten the lock nut.

Recheck throttle operation and install all removed parts.

Cruise Control

Throttle Cable Adjustment

Position the actuator on the bracket and slightly tighten the mount nuts. (Allow free movement of the actuator for further adjustment.)

Loosen the actuator cable lock nut and turn the cable adjuster until the front end of the control lever is in the groove in the case as shown.

Tighten the adjuster lock nut.

Tighten the actuator mount nuts.

Loosen the upper throttle cable adjusters to allow play in the upper throttle cable.

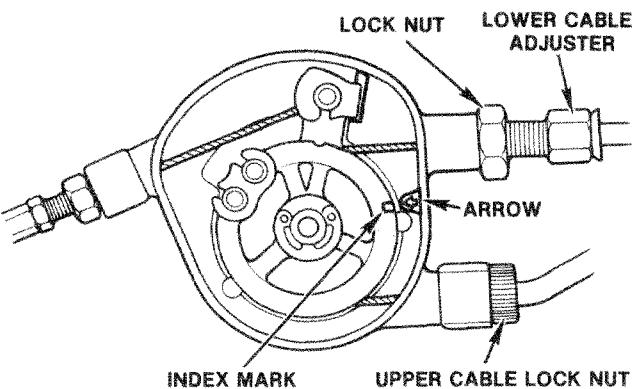

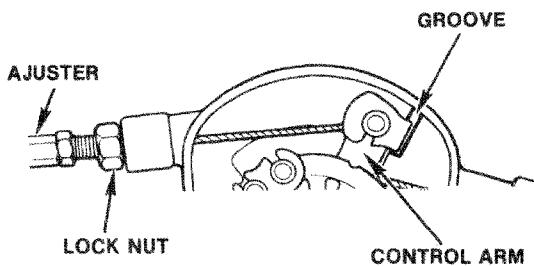

Turn the lower throttle cable adjuster to align the index mark on the cable drum with the arrow mark on the case.

Tighten the throttle cable adjuster lock nut.

Tighten the upper cable lock nut.

NOTE: Adjust throttle grip free play and check operation of the throttle grip and cancel switch. Recheck alignment of the index and arrow marks.

Install the junction box cover.
